Finally let me touch upon what I know is of primary interest to you and to Congressman Visclosky as you look to the next session of Congress and the reauthorization of the Highway Act. I know that you are looking for States and local communities to do their fair share. I want you to know that we in the State of Indiana intend to be complete and full partners in participating in the improvement of the infrastructure network of our State and, indeed, of our country. We have instituted, as you mentioned, a Build Indiana program, putting in during the next two years an additional $40 million of our new lottery proceeds into highway funding in our State. I had requested the State legislature to provide $100 million and we were successful in getting $40 million. I have not given up my efforts and continue to lobby our State legislature. I am reasonably optimistic that we will see additional funding from the State lottery into highway improvements in our State.

We have put into place a ten year comprehensive program so that no longer will funding priorities for highways in the State of Indiana shift with the prevailing political breezes. We have put into place a program that we think makes senses for all Hoosiers, regardless of partisan preference, and we intend to pursue that program during the next decade.

Finally, I would like to salute the head of our Department of Transportation, Christine Lutz, who is with us here today. Christine is in the back, Mr. Chairman, if she would please stand up. She came to us from the private sector, with one of our Fortune 500 companies, the Cummins Engine Corporation, and she has brought a great deal of professional expertise to professionalizing the Department of Transportation in the State of Indiana. We have streamlined the department and have cut overhead, and we are literally doing more with less overhead tax dollars. We are putting more of the tax dollars into pavement, which I think is where they belong, and I would like to salute her today.

Finally, with regard to the funding formula, many citizens in our State are probably not aware that the State of Indiana is a donor State and that we currently receive 85 cents on every tax dollar we send to Washington for highway improvements. We receive the 85 cents thanks to the minimum allocation. I would like to encourage this committee to support at least the minimum allocation in the Highway Reauthorization Act so that States like Indiana can continue to meet our highway funding needs.

We, of course, support streamlining the formula. I understand today there are 60 different funding highway categories. It is our recommendation that that be reduced to two, one for highways of national significance and, secondly, one for maintaining the current infrastructure. We would request most respectfully that more flexibility be granted to local authorities in distributing those funds for maintaining current highways.

Having said all of that, Mr. Chairman, I would again like to thank you for joining us today. I would like to compliment Congressman Visclosky for his dedication. I hope you have a very pleasant stay with us and we are most grateful for the full and complete partnership which I see developing in the area of improving our State's and Nation's transportation network.

Thank you.

[The prepared statement of Hon. Evan Bayh appears on p. 1952.]

The **Chairman**. Thank you, Governor, for your informative statement.

As the committee considers reauthorization of the highway legislation next year—as a matter of fact, that's what our hearing was this morning when I left—what issue is most important or critical from your perspective? I know you outlined some of them earlier. I thought you might zero in on which issue is the most critical.

Governor **Bayh**. Looking at the broader picture, Congressman, the needs for northwest Indiana.

The **Chairman**. Well, I would say northwest Indiana, but I suppose it's also a part of the broader picture.

Governor **Bayh**. Well, let me touch upon two things. As I mentioned, the Gary Airport promises to be the largest economic development project in the history of the entire Midwest.

The **Chairman**. I've written that on the top of the page.

Governor **Bayh**. According to the experts, it promises to create up to 200,000 new quality job opportunities for citizens in this area. That is vitally important and that's why I humbly requested that the decision be made on the merits. I'm sure, with the good offices of all of us present, we will be able to achieve that result.

With regard to surface transportation, maintaining the minimum allocation and giving States greater discretion in the use of funds will enable the State of Indiana to address the concerns of congestion and safety, one example being the Borman Expressway. It's vitally important to allowing continued growth in our population in northwest Indiana and, most importantly, new businesses to locate here, with the assurance that their goods can reach the market and that their workers can reach their plants conveniently and in safety. So I would consider those two things to be most important—the Gary Airport and maintaining the level of funding, or hopefully improving the level of funding, for surface transportation, so that we can meet the needs of projects like the Borman.

The **Chairman**. In older industrialized areas, aging facilities needing substantial rehabilitation or replacement pose a problem, while in growth areas the existing infrastructure must be expanded and modified to accommodate new residents and businesses. Undoubtedly, Indiana is experiencing both of these situations.

Now, what steps has the State taken or can it take to assist local governments to meet their unique infrastructure needs?

Governor **Bayh**. Well, your question is ideally suited for this part of the State, Mr. Chairman. We have both new growth areas and revitalizing urban centers here in northwest Indiana. We currently have under consideration a very innovative program that has been advocated by the business and local leaders of this part of our State called Operation Bootstrap. This would provide additional funding alternatives to local authorities for such things as transportation improvement, specifically the South Shore Railway and some other areas of local transportation and infrastructure development. It is that kind of partnership. The Federal Government is encouraging the States to work in partnership, and the State is encouraging local governments to work in partnership with the State. This is a regional group, not just including the county in which we meet today, but two contiguous counties, which has requested the opportunity to raise additional local funds to meet the pressing local needs, particularly in the area of infrastructure. That is one thing that we're considering at the State level, which I think is really innovative, even if you look around the country.

The CHAIRMAN. Pete, would you like to ask the Governor some questions?

Mr. VISCLOSKY. Mr. Chairman, just a couple of things.

Evan, I have always thought that we have a couple of things in common, the first of which I think is a couple of wonderful political fathers. It makes me nervous when the two of them are leaning up in the back of a room "kibutzing" while we're up on stage.

Governor BAYH. I would concur with that.

Mr. VISCLOSKY. Obviously, I think the other thing is we both "married up" and I congratulate you on your coup with the Chairman. [Laughter.]

I guess one of the observations I would make, and then I would have a question about funding formulas in terms of the reauthorization, is that I do appreciate the commitment the administration has made to our area as well as other areas similarly situated throughout the State, in terms of a willingness to do more. I do think it's important for the Chairman to understand clearly that whether it's Operation Bootstrap locally, whether it's the Build Indiana fund statewide, that Indiana, and I think other States in the Midwest, for example, are willing to do more, to do their part. But again, we do need that strong Federal assistance.

One of the questions in anticipation of the legislative debate next year is formula. I'm just wondering if you have a sense of whether or not this State, or others in our region, have examined the possibility of looking at weather conditions and temperate variations as well as that differential that the Chairman pointed out, of the crushing need of maintenance in many of these areas in terms of input for formulas.

Governor BAYH. Congressman, your question is right on target. It's very appropriate, and I would like to take this opportunity, Mr. Chairman, to tell you that our Department of Transportation is working with a coalition of other States, including your own home State of California, to offer our State perspective on the new formula that is under consideration, to consider such factors as growth patterns, the density of use, weather conditions and things of that nature. So our home State of Indiana and your home State of California find ourselves moving along the same path as far as the formula reauthorization is concerned. We think it's good policy to consider such factors as climate changes and their effects on serviceability, the density of use we think is extremely important to consider, and several other factors.

So, Congressman Visclosky, our Department of Transportation has been working hand in hand with a coalition of other States, including California, and we find ourselves in agreement on the factors that we feel need to be included in the new formula. We look forward to having that placed in technical terms that I'm sure the committee will want to consider at some point in the future.

Mr. **Visclosky**. I appreciate that, Governor. I guess I would simply conclude by again thanking you for the additional State commitment in terms of projects like the airport and your close monitoring of the situation we now face with Amtrak. We certainly will make every attempt legislatively, through Public Works as well as the Energy and Commerce Committee, to ensure continuation of the Amtrak service. We will stay in touch with you as we progress.

Governor **Bayh**. Thank you, Congressman.

If I could just make two points in closing, Mr. Chairman, one example of the kind of partnership that I think benefits us all—and I assume we'll be hearing from the Mayor of Gary later today—is what is taking place at the Gary Airport. For the first time in the history of the State we have provided a $500,000 grant to the city for the airport, which leveraged—correct me if I'm wrong, Pete—about $7.5 million of Federal funding that you were instrumental in obtaining for that site. So, Mr. Chairman, here we have a city that is very much interested in this development providing their own expertise and funding, with the State pitching in, and the Federal Government pitching in as well, to improve what we hope will be an exciting economic development facility.

The final thing I would like to mention—Pete, you were very kind to once again mention the Build Indiana fund. Mr. Chairman, let me just concur in what the Congressman said. We in the State are not asking for a handout. We want to do our fair share. I know that all 49 of those States are coming to you asking for more money. We want to be full partners in that. We are providing more monetary resources for infrastructure development. The $40 million was just the beginning. Local communities, through the Build Indiana process, have put in several billion dollars of requests for local infrastructure improvements. Those are currently under consideration by a committee which will make recommendations to me for forwarding to the next session of the General Assembly. So we are in a position at the State level of providing more than $100 million of local infrastructure improvements each and every year, and many of these are going to relate to airports, to highway projects, and in this particular community perhaps to marinas and port facilities.

So we have made a major investment in infrastructure and, consciously so, much of that will go to the local level. We would like to work in partnership with you and at the Federal level with Congressman Visclosky. So, Pete, thank you, and thank you very much, Mr. Chairman.

The **Chairman**. Thank you very much. One thing that kind of relates a little bit to it is—I know somebody mentioned earlier the fact that we have some trust funds back there for highways and airports and transit—you mentioned all three of those. But as you're aware, we have kind of a new problem, where the Office of

Management and Budget, which is part of the administration, has taken those trust funds from us and we can't use the money. In the highway trust fund, we have close to $19 billion; the transit fund has probably about $6–$7 billion, and $8 billion in the airport fund. So we have about $35 billion sitting there that we should be spending for airports, highways and transit but they don't let us spend it. We have tried to take it off budget and it just sits there.

We had one vote on trying to take them off budget and we lost by five votes. We have 435 people voting and you come as close as five to winning. So we would like to make sure that out in the States, they can get information and ideas from their own Congressman, on how important it is that we be able to get to that money. So that's one thing we would like to get some help on.

Governor **Bayh**. Mr. Chairman, you can count on our help for that in the State of Indiana. As a matter of fact, I was reminded of that by the head of our Department of Transportation on the flight up today. So please count on us. I know you have a tireless advocate in Congressman Visclosky as well.

The **Chairman**. Thank you very, very much, Governor.

Governor **Bayh**. Mr. Chairman, thank you. I can assure you that at least one constituent is extremely happy with you. [Laughter.]

The **Chairman**. I just wrote a note down here. I'm going to make sure she gets another call. [Laughter.]

Our next witness is the Honorable Thomas V. Barnes, Mayor of Gary. Mayor, I want to welcome you. We're glad you could be with us today. Please begin.

TESTIMONY OF HON. THOMAS V. BARNES, MAYOR OF GARY, IN

Mayor **Barnes**. Thank you very much, Mr. Chairman. I want to welcome you certainly to our area, as others have already done, and I am certainly hopeful that my remarks to you will be of some significance and importance in your deliberations on the reauthorization of the Surface Transportation Act.

I can't help but, in a sense, restate our delight that you are here, at least for a couple of reasons. First of all, I understand this Reauthorization Act, of course, will be crafted by the Senate Environmental and Public Works Committee and, of course, this House Public Works Committee represented here, and very ably by its Chairman. I understand also there is only one individual from Indiana that is on both of those committees together, and that is our Congressman Pete Visclosky. So despite that fact of our limited representation, if you will, we have the Chairman of this House committee here in northwest Indiana and for that I am extremely appreciative.

I am also appreciative of the fact that you had an opportunity in coming here to see and to visualize and to experience to some extent one of the resources that exists in this area that has great potential. That, of course, is the Gary Regional Airport. There has been enough said at this particular moment on that. But I think for the Nation and for the State, and certainly for this community, we cannot afford to allow that kind of diamond to go too much longer being unpolished. So I am certainly hopeful that the comments here and any of the ability that you have will be utilized to influence those who will be making the decision to make sure, as the Governor indicated previously, that a decision based on the merits and the needs are, in fact, taken.

I want to just share here on the reauthorization of the Surface Transportation Act some thoughts. First of ail, there are three overriding priorities that the City of Gary shares with local governments across this Nation. I hope that there will be a movement to, one, restore the funding lost through the Eighties to highways and transit; two, to remove the Federal barriers to State, local and private sector participation in federally funded projects; and three, to distribute funds on the basis of transportation needs such as more funding for areas of high traffic congestion, urban areas, and not just high mileage rural areas.

Our needs in this area of surface transportation are many and broadly based. Unlike some issues, transportation touches the lives of every single citizen in northwest Indiana. It does so on a daily basis. Increasingly, local government is being asked to pay a greater share in the cost of providing the means to travel, a share that we cannot afford.

In the City of Gary, we are currently undertaking a significant road project. I think it's one that is good for a number of reasons. It is the widening of Grant Street. This is a major thoroughfare in the city. The project has been on hold for ten years, ten years in the making. Why? Obviously, there are a lot of reasons, but one of the reasons is that we have had to come up with the local dollars in order to match what the Federal Government had made available to us. Fortunately, through a combination of local dollars and State participation, with the Federal Government, we see the real essence and the importance of that partnership, if you will. This project is moving now, and it is moving because we are able to come up with those local dollars.

But it has been difficult. It is difficult for us to meet it on the basis of a 90/10 grant situation. I know there has been some discussion of a change to 75/25 or a 50/50 plan. If implemented, that would make our situation hopeless.

This financial difficulty that we face here in northwest Indiana and in Gary is not limited to road projects. Public transit infrastructure is affected as well. The situation with the city's public transportation system, which provides bus service throughout the city, is just as dire. For the past four years, the operating budget allocated to the Gary Public Transportation Corporation has decreased on a yearly basis by $250,000 to $300,000. For some time, we have been able to make ends meet by trading some of our capital dollars for operating dollars in another jurisdiction, at a disproportionate exchange rate, I understand. But we are now between the proverbial "rock and a hard place" because our rolling stock is aging and we need our capital dollars making the chances for future bartering even slimmer.

We are not insensitive to the fact that the Federal Government cannot carry the load itself. We understand that. Perhaps that's the importance of the unique experiment, if you will, that three counties right here are making over the last few months. That is what you heard referred to as Operation Bootstrap. Operation Bootstrap represents an opportunity for us to determine how we can pool some dollars together, if you will, through a new tax in order to meet some of our own needs at an even greater level.

But, with the current formula that we've looked at, the Operation Bootstrap revenue would represent some $33 million of additional revenue per year, which is not a small amount, and yet, the needs that have been projected based on the needs analysis represent some one billion dollars. So you can see there is still a tremendous role that has to be played we feel, not just by our State which has been involved with us in this partnership, but certainly by our Federal Government.

We think the dollars generated from local initiatives, as well as those under the Act, are of critical importance to northwest Indiana's economic growth. These dollars provide the much needed means for localities to provide congestion free access to businesses. Good transportation infrastructure is also a proven element, as you know, in terms of attracting new businesses and spurring residential development. These are things that we need in Gary, IN. These are things that we need in northwest Indiana. What we are asking for is that the Federal Government reach out, as we reach out to each other, along with the State, in forging a partnership that we think can place some huge dividends for all of us.

Thank you very much, Mr. Chairman.

[The prepared statement of Mayor Barnes appears on page 1947.]

The **Chairman**. Thank you, Mayor. You almost answered my question, but I will ask you: As the mayor of an urban city right across the State line from—I could say but won't say—a suburb of Chicago, an even larger urban city, you undoubtedly must have to deal with many problems common to both. What effect does that State line have on how you handle your mutual problems and do you think that our Committee should be looking into a regional approach on some of these issues to help resolve problems that do cross State lines?

Mayor **Barnes**. I think it's impossible, Mr. Chairman, for us to ignore the real essence of the question you raise right here. We're dealing with it here in terms of transportation, but in every facet it is impossible for the City of Gary, for northwest Indiana, to not be affected by the tremendous metropolitan area that we are a part of, the Chicago metropolitan area. And while we, of course, look at Chicago more or less being a suburb of Gary, I think the essence of what you're saying certainly holds true.

We have a tremendous amount of problems that exist here, but we don't have the funding capability to meet all those needs. That is true relative to transportation, surface transportation, et cetera. It also deals with other areas that we're involved with, whether it be in terms of fighting crime, you name it. We're in a huge area.

They have the resources often to deal with some of the impact of that to a much greater extent than the smaller area here does. Certainly I think it's something that the Federal Government needs to take a look at in terms of balancing the equities.

The **Chairman**. The development of the Gary Airport as the third major regional airport would require a tremendous investment in other supporting infrastructure investments. Would you be able to fund other necessary infrastructure investments such as access roads, possibly bridges and everything else? To get a big active airport, the kind you're talking about, it will bring in all kinds of other infrastructure things. How would you handle some of those?

Mayor **Barnes**. We are confident that we can. This is one of the primary issues that we see now, the study that is now going on in our own areas. That is one of the reasons that the State has recognized this is not something that Gary can do, and it's not something that northwest Indiana can do. It is something we have to do in partnership with the State.

We are convinced that when the real picture is shown of the significant economic advantage that this provides to northwest Indiana and, in fact, to the entire Chicagoland area, it is going to represent the least expensive investment that can be made if we're going to preserve this huge transportation need that has been met to a large extent but here lately has not been met. It has really been causing this entire area to erode in terms of its overall air transportation capability.

We are convinced that the kinds of investment that the Federal Government can do, and also in terms of the private sector, they will see this as the very best means for us to spend dollars. Not only that, because of the existing infrastructure, the existing highway networks that certainly need to be enhanced, they don't have to be reinvented. That is going to represent a very inexpensive, comparatively, way of approaching the air transportation needs in this entire area.

The **Chairman**. Congressman Visclosky, do you have any questions of the Mayor?

Mr. **Visclosky**. Mr. Chairman, I don't. But I do have a statement.

Mayor, I think you brought up one telling point, and that is for the Federal Government to join the debate about the reauthorization of the highway bill, to talk about giving local officials such as yourself, the mayors, increased flexibility, and then to stop there is missing the point. It refers there to the testimony of the Secretary of Transportation Skinner in March before our full committee, which the Chairman chaired.

The fact is, in that testimony Sam Skinner talked about improving the lot of locales and States by granting them that increased flexibility, flexibility to raise new taxes, whether it be through toll mechanisms or other options, such as you have talked about with Operation Bootstrap. In the end, if that's as far as the administration goes, or in our case, the Congress goes, in terms of reauthorization, then we're simply paying a cruel shell game with you by taking moneys proposed in Operation Bootstrap and supplementing the lack of Federal commitment with them. We are essentially misleading the local communities and the State if we do that.

It is one thing to say you must do more, as you point out in your statement. But if there is not going to be that increased Federal commitment, we might as well not be here today having this discussion. I think that's the point that has to be made in hearings like this and I appreciate you for bringing it up.

Mayor **Barnes**. Thank you very much.

Mr. Chairman, thank you again for you and Congressman Visclosky being here, for asserting your efforts and seeing that the Chairman was here on this particular day. We certainly stand ready to assist in any way that we can in providing information relative to the needs here, and certainly some of the ideas and thoughts that we have in terms of how we approach them.

The CHAIRMAN. Thank you, Mr. Mayor.

I want to warn you about something, too. Being mayor, I was mayor of my city 51 years ago, and I'm still working. You never know what it brings to you. This is 51 years right now. So watch it. It could happen to you.

Mayor BARNES. Mr. Chairman, you probably can also testify that I'm sure life is a lot easier now than it was when you were mayor. [Laughter.]

The CHAIRMAN. Yes, it is. But one of the nicest jobs I ever had was mayor. It's fun being down there with the people right where the problems are. It's a little different being 3,000 miles away.

Mayor BARNES. I certainly agree with that. Not only that, I think we are very fortunate for the reason I mentioned your being here, but certainly the broad experience that you have had. You bring some expertise to this whole issue that otherwise might not be available. We really appreciate it.

The CHAIRMAN. I might wind up by saying you're also fortunate in one way. You've got Pete Visclosky as your Congressman.

Mayor BARNES. We agree with you wholeheartedly.

The CHAIRMAN. Thank you very much, Mayor.

Mayor BARNES. Thank you.

Mr. VISCLOSKY. Mr. Chairman, I might simply ask leave to have the statements of the Mayor of East Chicago, the Honorable Robert Pastrick, and Mr. Ronald Bradley for the town of Highland, and statements from the communities of Highland and East Chicago entered into the record.

The CHAIRMAN. If there is no objection, so ordered.

Next we have a panel composed of Mr. David S. Williams, Commissioner of Public Works for the City of Chicago; Mr. Bud Polk, Executive Director of the Calumet Area Industrial Commission, Chicago; and Mr. Jim Ranfranz, Executive Director of the Northwestern Indiana Regional Planning Commission, from Highland, IN.

You can start in the order in which you were introduced, if you want, or however you want to proceed. I will call on Mr. Williams first.

TESTIMONY OF DAVID S. WILLIAMS, COMMISSIONER OF THE DEPARTMENT OF PUBLIC WORKS, CITY OF CHICAGO; ROTHWELL CONWAY POLK, JR., EXECUTIVE DIRECTOR, CALUMET AREA INDUSTRIAL COMMISSION; AND JAMES E. RANFRANZ, EXECUTIVE DIRECTOR, NORTHWESTERN INDIANA REGIONAL PLANNING COMMISSION

Mr. WILLIAMS. Thank you, Mr. Chairman. It is certainly a pleasure to be in northwest Indiana this morning. After the testimony of the Mayor and also the Governor, I feel like a thorn amongst roses.

Before I start, let me say we certainly do appreciate your efforts in recognizing infrastructure needs in the entire country, primarily those of transit and rail bridges, water treatment, et cetera. We certainly applaud your efforts in that area.

My testimony this morning, however, will be confined to the Chicago Skyway. The City of Chicago is responsible for the Chicago Skyway, which is a designated segment of Interstate 90. The Skyway is a 7.5 mile toll bridge facility on the southeast side of Chicago connecting the Dan Ryan Expressway, which is part of Interstate 94, with the Indiana Toll Road, which is Interstate 90 in Indiana. The Skyway currently carries approximately 20,000 vehicles a day, which is less than half of its capacity. The nearly parallel Calumet Expressway, which is a toll-free facility, carries about 80,000 vehicles per day and is severely congested on a regular basis.

The Skyway was constructed with revenue bonds by the City of Chicago in 1959 at a cost of about $101 million. Its current traffic volumes generate approximately $15.8 million a year in toll revenues. This $15.8 million is allocated roughly $3.6 million on the interest of the debt, $5.5 million for capital rehabilitation, another $5.5 million for operating costs, and $1.2 million for insurance.

The toll revenues have never been, nor are they ever projected to be, sufficient to pay the principal. The Skyway tolls are $1.75 per car and average $5 per truck. Up until this year, tolls have been regularly raised by court order to assure payment of interest to the bondholders. But the court rejected the bondholders' latest request to raise the tolls to $2 per car because a further increase would be counterproductive.

The $101 million in principal owed to the bondholders remains outstanding and will remain outstanding until a new funding mechanism is found.

In addition to the principal, the Skyway needs $75 to $100 million in major capital rehabilitation work. Although the Skyway is a designated segment of Interstate 90, it is not eligible for Interstate 4R funding because the State of Illinois and the City of Chicago are required by Federal law to enter into an I-4R funding agreement before these funds could be made available for the Skyway.

While the city is faced with the need to maintain and improve the Skyway and to pay off its bonds, the State of Indiana is facing severe congestion on the Borman Expressway which parallels the lightly used Indiana Toll Road. The city is a participant, along with the Illinois Department of Transportation and Indiana, in a federally-financed study of how best to relieve the congestion on the Borman Expressway.

One of the solutions being studied is to pursue a Skyway toll reduction or elimination strategy to divert traffic from the Borman to the Skyway/Indiana Toll Road route. This approach could be the cheapest, fastest way of alleviating the existing traffic congestion on the Borman. Eliminating Skyway tolls would require retiring the bonds. Thus, in one action, the Skyway's financial problems and northern Indiana's congestion problem could be relieved.

The interstate congestion/underutilization problem in northwest Indiana and the adjacent Chicago urbanized area in Illinois is probably unique in that the narrow corridor on the southern shore of Lake Michigan has one interstate that is toll free and a somewhat parallel interstate, the Skyway/Indiana Toll Road. While the motoring traveler can save approximately 20 miles or 20 minutes of travel time by taking the Interstate 90 alternative, it will cost him just over $2 in tolls. It is obvious that underutilization of Interstate 90 because of the tolls is contributing to the congestion of the toll-free Interstate 80/94 Borman Expressway. It is unusual to have toll interstate facilities and toll-free interstate facilities in the same corridor competing with each other.

We would greatly appreciate your attention to this interstate congestion, underutilization, and funding problem in the 1992 Reauthorization Act. It is hoped that the Borman study will result in more specific recommendations which address not only the Borman's congestion, but also the related problem of funding the underutilized Skyway, which is a part of Interstate 90.

[The prepared statement of David S. Williams appears on p. 2016.]

The CHAIRMAN. Thank you, Mr. Williams. I will hold my questions until we've heard from all three of you.

Mr. Polk.

Mr. POLK. Thank you for the opportunity to testify, Mr. Chairman.

The CHAIRMAN. You're Director of the Calumet Area Industrial Commission.

Mr. POLK. Yes. My name is actually Rothwell Conway Polk, Jr. "Bud" is a little easier to remember. I happen to be a resident of the town of Porter, IN and a constituent of Congressman Visclosky.

I am here today in my official capacity as spokesperson and Executive Director of the Calumet Area Industrial Commission, or CAIC, which is a 22-year old, not-for-profit economic development agency, a membership organization of industry and related enterprises in the south metro area of Chicago.

CAIC's position is based on two principles. First, to maximize the use of existing transportation networks and infrastructure, because we all know, to build new highways, new infrastructure, it costs many dollars. Second—and this came up in the testimony from Mayor Barnes—is the imperative need to plan regionally. CAIC recognizes that northeast Illinois and northwest Indiana are one region. It's economy is inextricably bound together. In spite of the decline of the steel industry, the southeast side of Chicago and northwest Indiana remain the largest steel producing and steel processing region in the world.

There are many people who live in Indiana and work in Illinois, or who live in Illinois and work in Indiana. I have a board of directors of 27 members. All of them have businesses in Illinois. Nine of them live in Indiana, as do I, even though I work in Chicago. It makes no sense to talk of the traffic and transportation needs of northwest Indiana without considering where those vehicles are going to or coming from, and that is the Chicago metropolitan region. And so our second principle is that we strongly endorse and strongly encourage regional planning between northwest Indiana and the Chicago metro region.

Based on that, we have a number of suggestions. I concur with Commissioner Williams. Based on anecdotal as well as statistical evidence, I have driven the Indiana Toll Road and the Chicago

Skyway. It's virtually deserted. We need to find a mechanism to reduce or remove the tolls from the Chicago Skyway.

One of the reasons is that 40 percent of the traffic on the Borman is truck traffic. Much of that traffic is headed into Chicago because of the interstate commerce. By alleviating the tolls—the Commissioner said the average toll for a truck is $5. It can be as high as $10 for a truck to get through the Skyway. If we remove the tolls, then we remove much of the traffic from the Borman.

A second issue related to the Skyway which again would help alleviate congestion on the Borman is to develop new exits on the Chicago Skyway, particularly at 95th Street, so as to service the Illinois International Port, the Iroquois Landing, which generates a lot of truck traffic. It's a containerized facility. So an exit off the Skyway at 95th would take some of that traffic off of the expressways.

Another suggestion of the Commission is that we extend Cline Avenue west into Chicago. You mentioned that you had done some driving on Chicago. If you want to die, go and lay down on Cline Avenue west of Indiana Harbor. The reason you will die is not by being run over, but you'll starve to deal because there's no traffic there. It ends near Wolf Lake, and we need to look at routes to connect with other transportation networks.

I want to talk now about the South Shore and mass transit. The most used station of the South Shore Railroad is not in Indiana. The highest volume of traffic is in Chicago at the Hegewisch station on the southeast side of Chicago. The Commission suggests two things: The development of another station in southeast Chicago, perhaps at 130th Street, somewhere near the Calumet Expressway, and that the CPA, the Chicago mass transit, be extended and linked with the South Shore. Then, if we had this kind of mass transit, we again might be able to eliminate some of the auto traffic on the Borman headed into Chicago.

Our last suggestion is that the heavy steel corridor which exists in northwest Indiana—and that's a corridor which allows a special truck called a "Michigan Train" to carry steel coil, which is sometimes twice the load limit, a specially designed truck—we have such a corridor in Indiana at this time. We suggest a Federal demonstration project to extend Indiana's heavy steel corridor into the State of Illinois, and then to extend that to service the east side of the Illinois International Port, also at 122nd Street, also at 95th Street, the Iroquois Landing, and then to extend it further down 130th Street.

Because, you see, if you ride the Borman all day long, you see these large trucks with coil. Where they're going is not some State far west. They are going into Chicago, to steel service centers, for the coil to be processed. Then that coil is used in the fabricating plants in Chicago. Chicago is the largest steel fabricating region in the United States. So by extending the heavy steel corridor, we actually reduce the number of trucks using the Borman or using other routes, because they can carry a larger and heavier coil.

In conclusion, let me emphasize again that the Commission feels that we have regional problems and that they call for regional solutions.

The **CHAIRMAN**. Thank you.

Mr. Ranfranz.

Mr. **Ranfranz**. Thank you, Mr. Chairman. I have prepared remarks and have submitted those to the committee. I think, rather than reading them to you, I will try to paraphrase what that says and try to emphasize some of the points that were made by other speakers and try to raise one or two new ones for your consideration.

First, I, too, on behalf of the 39 cities and towns that I have the pleasure of representing at the Northwestern Indiana Regional Planning Commission, would like to extend our welcome to you to be here at Indiana's north coast. I could not imagine the committee picking out a better place to come hear testimony about transportation problems because I believe strongly we have here in northwest Indiana a microcosm of the national transportation problem, whatever mode you would choose to look at. Indeed, if I had my druthers, Congressman, what I would do is have a mobile hearing so we could go around and see some of these problems and you could carry that information back on a first-hand basis to Washington.

The **Chairman**. Don't you think we're doing that?

Mr. **Ranfranz**. Indeed, you are. I just wish we could get you over more of the territory. I would like to get you on the Lake and let you see what that's like.

First I want to thank you for the action that the Congress has taken in appropriating a half-a-million dollars to the States of Illinois and Indiana to do the Interstate 80/94 congestion relief study. Aside from the opportunity to direct funds at a particularly difficult problem that's been referenced here in the past, there is an aside that I think is appropriate. What we're seeing as a result of this activity is a far greater degree of technical and political cooperation and coordination across the State line than that which has existed in the past. I think this is an excellent example of the 3C planning process that our agency, as a metropolitan planning organization for northwest Indiana, represents.

We would urge you, in any restructuring of the Surface Transportation Act, to give serious consideration to reinforcing our ability at the local level to sustain this process. Metropolitan planning organizations, we believe, have an important role in the decision making process that involves local units of government in the way which we believe they should be involved.

This is done not without some cost. We are, indeed, constrained in that regard in Indiana. So please, as you give consideration to restructuring, pay attention, if you would, to the metropolitan planning process.

The proposal, as best we understand it, in the Highway Act for combined funding of highways and transit we think is a good idea, but it, too, will require an even more technically sound planning process. We think that is sufficient cause for you to again consider support to the metropolitan planning organization.

We also ask that you give consideration in the structuring of formulas, as previous testimony has indicted. While we can make decisions at the local level, we do not have the resources, particularly in Indiana, the ability to raise resources to replace the resources that have been provided in the past.

There has been much testimony here about Operation Bootstrap. Our organization, together with a group called the Northwest Indiana Forum, is involved in the preparation of a legislative proposal that we are convinced will be introduced in the next session of the General Assembly. The point I wish to make is that it will require the action of the Indiana General Assembly to, in effect, take restrictions off of us at the local level so that we can raise funds to try to very much help ourselves in a way which is supplementary to Federal and State programs.

One other point. We think that Congress is very effective in passing laws that are probably very needed, the American Disabilities Act and the Clean Air Act, but our ability at the local government level to raise the revenue to respond to those problems, no matter how important they are to the environment or to human need, is very difficult. We urge you to give some consideration to the notion of the revenue capability to respond to those legislative initiatives.

Mr. Chairman, finally, as a particular frustration of mine, I call to your attention one additional notion. As we move into a new system, whether it's a highway system of national significance or a subset of that, that some consideration be given by the Congress to finding an opportunity so that those of us at the State and local level would have the ability to preserve corridors, or what I would call corridors of the future. We have had examples here of folks calling for the extension of certain roadway facilities. Our ability to do that now is severely constrained by our inability to acquire in a rapid fashion routes to preserve corridors. Whether those corridors are transit corridors or highway corridors, we believe there has to be some shorter term ability to preserve the paths for the future. Eight years from concept to concrete is far too long a period of time for us to really save what needs to be saved.

I think at this point, Mr. Chairman, I will end my testimony.

[The prepared statement of James E. Ranfranz appears on p. 2011.]

The **Chairman**. Thank you very much. Your full testimony will be made a part of the record. My questions will be directed to all three of you, so one or all of you can answer the question.

Is it totally out of the question for the City of Chicago alone, or in conjunction with the State, to subsidize the Skyway in some way in order to reduce the toll rate, or even to bail it out entirely, as a means of encouraging its greater use and reducing congestion on other expressways?

Mr. **Williams**. I guess the question is, Mr. Chairman, whether or not the city can reduce the toll. I think there are a couple of answers to that. One is that it was floated as a revenue bond item back in 1959. As a result of that, there are bondholders that are holding the bonds and who are expecting payments. As a matter of fact, just a couple of years ago, we were able to meet just the interest payments, but no principal has been paid at this point. So, in 1995, we have a $101 million liability that the bondholders are expected to be paid for. We have that on the one hand.

On the other hand, which I guess is the same hand, we have about $75–$100 million of capital needs. The entire structure is all on bridges, about 7.5 miles of bridges, and those bridges, in this temperature here, deteriorate with the salt and the snow and extremes in temperature. There are piles and there are all kinds of structural problems with this facility, not to the point where it will break down tomorrow, but we have to maintain it with some kind of preventive maintenance schedule, which we don't do and should do more of.

So I think it will be almost impossible at this point to reduce the tolls. One, we have the bondholders who are expecting their interest payments and, in 1995, the principal. But certainly, if there was an infusion of capital into the system, wherever that infusion came from, whether it came from the Federal Government, State government or what have you, certainly that could go to the possibility of reducing the tolls, once the capital needs of the bondholders are met.

Mr. RANFRANZ. Mr. Chairman, I wonder if I might respond to that question in a slightly different fashion.

The CHAIRMAN. Go right ahead.

Mr. RANFRANZ. Again, I would like to emphasize your consideration upon completion of the Borman congestion relief study, because I believe very strongly there will be some unique opportunities identified that might call for congressional action that would be not what I would refer to as traditional kinds of highway or congressional responses to severe traffic problems of this particular metropolitan area. They may call for the Congress to do things which they have not done, indeed, in the past.

We are not in complete ability to control our own destiny, as the Commissioner of Public Works from Chicago testified. The Federal court is responsible for the administration of the toll road, the Skyway. We have a Toll Road Authority that's been authorized under certain activities. I-80/I-94 itself, the freeway, has been constructed on the basis of congressional directive. If we are to respond to some of those problems, my point is simply that we may have to do something different that certainly will involve the action of the Congress in almost any one of those scenarios.

I just urge your attention to that study, sir.

The CHAIRMAN. Mr. Polk.

Mr. POLK. I would like to point out one thing regarding the cost. Commissioner Williams pointed out that there are $101 million in bonds outstanding, but that paper has been sold on the secondary market and has been discounted. Therefore, the actual cost of paying off those bonds might be closer to $25 million rather than $101 million. The paper has been discounted and sold on the secondary market.

The CHAIRMAN. Thank you.

Are there any alternatives or traffic management techniques being considered that would increase the use of the Skyway and ease the traffic problems on the expressways?

Mr. POLK. Mr. Chairman, there was a point that I wished to make in my testimony and forgot. In Illinois we have the Minuteman system, where the State has large tow trucks that are equipped to help motorists in trouble. I have read that delays on the Borman, 50 percent of them are due to what are called "incidents"; that is to say, mechanical breakdown, flat tires, people running out of gas or accidents. The Minuteman system in Illinois is considered to be a model and has been examined by many other

States. So when there is an auto accident, when someone runs out of gas, when there is some problem, the Minuteman, in close conjunction with the State Police, very quickly resolve the situation and keep traffic moving in Chicago.

Since 50 percent of the delays on the Borman are caused by incidents, it certainly should be suggested that a similar system be considered to be adopted in the State of Indiana, the Minuteman system with the State Police.

Mr. **RANFRANZ**. Mr. Chairman, I have two responses to your question, if I may. The first point I think is significant. Unfortunately, in northwest Indiana we do not now have a system, a balanced transportation system. It is a goal of ours. It is something which we are attempting to achieve over time. I would urge you, in consideration of the Surface Transportation Act, to keep in mind that balanced transportation in urban areas is essential, with the right component associated with public transportation. In this metropolitan area, we need, as previous testimony has indicated, a commitment of Federal resources to public transportation improvements. If, indeed, we are going to relieve our highways, we need that investment.

The second point that I wish to make, sir, is that we need, I think, a system which allows us to make improvements to the existing highway network in a fashion simpler than today's.

Signal timing. I have a raftfull of plans, Congressman, I could take you to in my office that, if implemented, would have made major improvements to the existing highway network. We don't have the dollars to accomplish those much needed improvements. Whether it's a signal timing system on the road that you front on, or the ability of the 16 cities and towns that use that road that it belongs to, we don't have the dollars to make the needed improvements. Your consideration in Congress in the restructuring of the Act, those kinds of projects can make for a relatively modest dollar a significant improvement in the ability to move traffic.

The **CHAIRMAN**. Mr. Williams.

Mr. **WILLIAMS**. Mr. Chairman, my one response here is I think the Chicago Skyway—I don't want to paint a bad picture here, but if the status quo remains, I think the traveling public can expect additional toll increases. I think that will also reduce the traffic on the Skyway and also the west end of the Indiana Toll Road, but it will also increase traffic on the free roads, i.e., the Borman. The facilities would deteriorate faster than they can be rehabilitated, and it continues as a toll road well into the year 2000.

I think there has to be some other options that have to be considered by the committee and Congress. Whether that is additional freeways, whether or not there's funds for rehabilitation, whether it's a bail out of the Skyway debt, whatever those options are, I think you have an opportunity here of an underutilized roadway that could relieve a lot of the congestion that is experienced in northwest Indiana. If that can be rectified, I think a lot of the problems would be taken care of.

The **CHAIRMAN**. What impact does the traffic congestion on the expressways have upon businesses and industry in the area?

Mr. **Ranfranz**. Mr. Chairman, I suspect you'll hear testimony about that by others that are present in this room, but I'll just get my lick in, if I may.

It has a tremendous impact. The Borman Expressway is truly, notwithstanding the sign on the Indiana Toll Road, Indiana's main street. The ability of our economy to respond in itself, right here in northwest Indiana, is adversely impacted in a severe and major way by the incredible congestion that exists already on the road. With such single dependence on this main street, our economic future is limited. We have plans, as I indicated earlier, for other improvements that are necessary. But key to those is the improvement along 80/94.

The **Chairman**. We are trying to come to people like you to get ideas of what you think we should be doing. Of course, the interesting thing is, wherever we go, it is a little bit different. The day before yesterday I spent close to a day in the City of New York just looking at their bridges. I personally visited at least—I'm saying 27, but I think it was even more than that—27 different bridges that were built 30, 40, 50 years ago at least. They're rusting. They use the word rotting from rust, but they're rusting. Had they been properly painted when they were first built 40 years ago, they would probably be just as good, they tell us. But when you don't paint the stuff, or don't put the right things on it—and the climate is different in different parts of the country—in New York, almost every one of those bridges is going to have to be rebuilt. It costs money to tear them down and rebuild them. It will be in the billions of dollars.

Of course, like I found out, originally the Federal Government helped with the money in building them, but then when they wanted to get some money to help maintain them so they could paint them and things like that, I guess there was a law against it. Obviously, today we know it's the best dollar we could have ever spent. If we would have given them some money to paint the iron before it was put up there, it would be in good shape today. Apparently, with weather in certain parts of the country and other things, minerals and things that are in the water in different parts is the thing that affects them so much. We learn this by going to New York or someplace else. Every place is a little bit different. That's why we're asking these kinds of questions.

Mr. **Williams**. I agree with you, Congressman. The same thing exists in Chicago. We have 43 movable bridges in Chicago, in which some are in this particular area, the Calumet River area, but there are also some downtown. Some of the rust in those bridges is such that—one of my engineers mentioned the bridges go up and down by memory at times.

But our projections for our bridges, the need for bridge rehabilitation in the City of Chicago runs about $40 million a year for the next ten years. So we're dealing with $400 million at this point. At the present rate, we have funding for the next five years of $20 million. So we have a $20 million gap in just trying to maintain the existing bridges.

The **Chairman**. Mr. Visclosky.

Mr. **Visclosky**. Thank you very much, Mr. Chairman.

I would like to start by thanking all three individuals on the panel, but especially the Commissioner for traveling from Chicago and giving us a day of your time.

In terms of topics, I would also like to at least briefly synopsize my situation in terms of the Skyway. I attach a lot of importance to the study that is currently being undertaken, examining not just the situation with the Skyway, but its interrelationship with other transportation needs and the Chicago metropolitan area and how we ought to best intentionally and uniquely deal with some of these questions.

I think even if we reached a perfect world, if you assume a perfect world is the elimination of the tolls on the Indiana Toll Road, where we're competitive, as well as the Skyway, that's not going to solve all of our problems. But I certainly do think that it would lead to an improved situation. I do think improved use of the Skyway has a multitude of beneficial impacts. I think, first of all, in terms of additional lane mileage, we avoid the whole question of time delay and acquisition of right-of-ways. If you look at it in terms of an environmental policy, I think it's a good one. If you look at it in terms of energy conservation because of a shorter distance traveled, it's a good one. If you look at the cost of maintenance because of a shorter distance of roadway, although obviously we're talking about a raised structure, in the end I think you're talking about fewer dollars. And if you're talking about ultimately the purpose of having the roadway and bridge there in the first place—and that's the productivity to our society, for both private individuals and commercial use—it's there.

One of the things I would want us not to do is to leave today with any doubt, in terms of the hearing record, about the magnitude of the problem or its potential cost. There is some difference, and obviously we're simply giving estimates in terms of what the potential is, ranging up to $100 million or more, if we're talking about rehabilitative cost, down to potentially $25 million. I must state that I think 25 and I appreciate, Mr. Polk, your observation that the bonds are discounted—it was only some months ago that I appeared on a panel in Chicago with some of the lawyers representing the bondholders. If I received any indication at that meeting at all, perhaps we're not talking about 100 cents on the dollar, but potentially we're not talking about market value, either. I don't hold you to the 25.

But, Commissioner, I guess, if you might want to expand a bit about at least some of the potential ramifications in terms of the costs we're really talking about here.

Mr. **Williams**. Yes. You mean the specific costs for what needs to be done——

Mr. **Visclosky**. The funding and work that needs to be done in terms of the options or lack of options for you, for the City of Chicago or the two States involved to pick up the entire load.

Mr. **Williams**. Let's talk in terms of the physical condition as we see it by the engineers that have given us some idea. This was a report that was completed last year. They have given us a figure of about $55 million that excludes design and inflation costs from last year. But items such as bridge and viaduct rehabilitation, roadway rehab and safety improvements, lighting, toll plaza, Michigan and

Indiana ramp demolition, those costs run right now at $55 million. I imagine, after inflation and design costs, that would probably be up in the area of about $75–$80 million.

The options, as I see them, as we talked about before, I think if we think in terms of additional freeways to relieve congestion on the Borman, I think that would probably be the most expensive option. The Indiana Toll Road and the Chicago Skyway still remain underutilized.

Federal funds for rehabilitation, we probably need, as I mentioned before, around $75 million to rehabilitate the structure. The Skyway would remain a toll road for at least ten more years, if we assume that the money came for rehabilitation only. We'll have some investment bankers to take a look at that issue, so don't hold me to that one exactly.

If we had a Federal bailout of the Skyway debt. we would need roughly—my counterpart here says somewhere between $25–$101 million. You're still talking money, I imagine, at that point. But additional funds will be needed for repairs, as we said before. So, you know, those are some of the general kinds of things that I see.

I don't think the status quo helps anyone. The status quo simply means that the Borman continues to be congested. The Indiana Toll Road and the Chicago Skyway remains underutilized and it just deteriorates faster because the money and the resources aren't there. Then eventually you'll have some kind of "doomsday" decision just to close it down because you don't have the money to fix it up. So that's how we projected out in the future.

Mr. **Visclosky**. I appreciate that.

The second thing I would want to touch on is the question of tolls and toll roads generally, not specifically in this instance talking about the Skyway. I think there is an element in terms of the reauthorization debate that tends to be simply spoken but not discussed, and that is an option in terms of increased revenues on toll roads. Let's talk about that specifically.

Assuming for the sake of argument that we're talking about coming up with additional moneys through some type of tax—and I won't ask any of you to make that assumption; let's assume it for the sake of argument—and secondly, all other things being equal, we're talking about an increase in terms of the gasoline tax to provide the additional Federal funding or potentially, the alternative use of tolls in the imposition of tolls for the construction of toll roads. Would any of you have preference or an opinion vis-a-vis the two alternatives, and would you care to make a comment? I think again we tend to simply talk about toll roads without baiting its efficacy vis-a-vis an increase in the gasoline tax.

Mr. **Polk**. Congressman, in answer to your question, both moderate tolls and a moderate gasoline tax. Rather than a higher gasoline tax or higher tolls, I can see a scenario where we had both as being more palatable, rather than people paying high prices at the pump because of a higher gasoline tax, or being irritated by high tolls on a toll road. They could both be kept moderate by having both.

Mr. **Williams**. Let me just say here, I think you have to have some combination of both. One, to start a toll road at this point does not necessarily help that part of the infrastructure that already exists. You can't put a toll road in downtown Chicago, for example. But there has to be a means to maintain that roadway. I assume the cost of that would come primarily from some kind of motor fuel tax. So you would need some kind of additional resources in the trust fund or, in some cases, State allocations of its own highway tax dollars to maintain that part of the infrastructure, that which is already there.

There is room for tolls. I think that as more demand for truck traffic and the movement of goods from point A to point B and the most efficient uses to transport those goods, I think the traveling public and also businesses should pay their fair share of that cost. From that standpoint, I wouldn't have any objections to those at all. But there has to be some combination of both.

I'm ducking the Skyway issue along those lines because I think that's a unique situation that has to be looked at separately.

Mr. **Ranfranz**. Who am I to disagree with two such experts as these. [Laughter.]

I would say, though, there has been some discussion that has been raised as one of the alternatives with respect to the Borman Expressway. But I would point out to you two things. One, there is a cost associated with establishing tolls, especially if you're going to establish them on a freeway.

There's a legal issue involved. You have paid for the road. How do we now go back and establish a toll road on a piece of the Interstate System? I think that's an issue that you have to address.

There's a bond indenture associated with the Indiana Toll Road that would, of necessity, have to be dealt with. It's been dealt with in the past, but it would have to be—there are real costs associated with that in any event. If everybody would agree on what the solution is for this particular problem, undoubtedly you would have to deal with it.

Mr. **Visclosky**. Mr. Chairman, I want to cover just briefly two other points. One is just to make a comment to Mr. Polk, who in his testimony talked about the possibility of a demonstration project. Mr. Ranfranz talked about our keeping an open mind about taking some unique approaches when the study comes back, in terms of the transportation system in northwest Indiana.

I think one of the procedural debates in anticipation of the reauthorization of the legislation being considered is whether or not there will be demonstration projects enumerated within the legislation, the controversy being should you simply have a national program in place to set formulas, or should you allow a demonstration project, the criticism being that sometimes it leads people such as myself to mischief. But I think both of you, in your own fashion, indicated that there are positive, rationale reasons why, because of the uniqueness of an area or problems you face for demonstration projects to be included in such legislative activity.

The last question is for Mr. Ranfranz, and that relates to the question of corridor preservation. I know Janet Moran and others have attempted to secure a right-of-way for the West Lake Line that you touched on, Jim. Would you care for a moment or two to potentially elaborate, because I do think it's an important point in terms of the difficulties you have experienced in northwest Indiana about anticipating the future, which I think has tended to be one of our problems in the past.

Mr. **Ranfranz**. Yes, sir, of course.

The issue of corridor preservation is one which applies, I am sure, not only to this urban area but to urban areas around the country. There has been a transportation plan in northwest Indiana in one form or another for the last 20 years. On that plan there have been corridors identified which have been clearly needed. Yet the resource capability to respond to the need has not existed. As a result, in one particular case there is reference to—the name has been identified as Cline Avenue. There has been talk about extending it to the north and to the west. Indeed, our plan for the last 20 years has been to extend it to the south. To do that today, we would have to buy a high school, innumerable housing projects, and notwithstanding the lack of local coordination, it would be a virtual impossibility to accomplish that.

The plans that we have on the books now call for the establishment of a south suburban expressway. Whether toll or free, that's another issue in that particular case. Yet, that's located in an area that is growing quickly. We are moving, in cooperation with the local units of government affected, having learned our lesson with the Cline Avenue extension, to try to preserve that corridor purely at the local level. We have yet the capability financially to get that done, and we have a willing State partner that is trying to assist. Yet the resources are not there to make an advance acquisition. So I don't know if that's responsive to your question, Congressman, but I believe very strongly that we have to design a system that responds much more quickly, the ability to respond more quickly, especially in those areas that are urbanizing.

Mr. **Visclosky**. Mr. Chairman, thank you very much.

The **Chairman**. Thank you very much for your presentations.

Mr. **Ranfranz**. Thank you.

The **Chairman**. Our next panel is a panel of two, Mr. Colin MacKenzie, Chairman, Transit Finance Committee, Northwestern Indiana Regional Planning Council, Ogden Dunes, IN, and Mr. Gerald Hanas, General Manager of the Northern Indiana Commuter Transportation District, Chesterton, IN.

Gentlemen, you can proceed in your own order. I would like to remind our witnesses, because so many have offered to help, we have several people to go yet. By agreeing to be here today, I must ask that all oral statements should be held between three and five minutes. Your whole written statement will be made a matter of the record. So just kind of help us a little bit. There are five after you.

TESTIMONY OF GERALD HANAS, GENERAL MANAGER, NORTHERN INDIANA COMMUTER TRANSPORTATION DISTRICT; COLIN MacKENZIE, CHAIRMAN, TRANSIT FINANCE COMMITTEE, NORTHWESTERN INDIANA REGIONAL PLANNING COMMISSION

Mr. **Hanas**. We will do that, Mr. Chairman. I will hasten my presentation here. We will just leave the comments as filed. I would like to highlight a few issues that we have.

I am the General Manager for the Northern Indiana Commuter District. We own and operate the South Shore Railroad passenger service, which has been referred to in the past. In essence, we're next to a large metropolitan area and many of our commuters go into downtown Chicago for employment reasons. Our job at the commuter district is to manage this rail system.

We started this system actually in the early 1900s as an interurban system, and it still exists today. We became involved in it in 1976. The equipment was 50 years old, starting in 1926. So as far as infrastructure is concerned, we utilize our infrastructure to the maximum.

The success has been good in our 12 years of involvement. The Federal investment through UMTA has purchased new rolling stock. Ridership has doubled over that 12 year period, and where we had 3,000 people taking the train in 1976 with equipment that was 50 years old, once we were able to rehab that equipment in 1980 with the help of UMTA, we now have over 6,000 people a day riding the service. We move as many as 13,000 people on a two-way trip basis daily. The annual ridership is impressive. It has moved from about 1,700,000 people to 3.5 million people on an annual basis.

We think the Federal and the State investment over the years has paid off. They are very important benefits for northwestern Indiana that have resulted as a part of that investment. One is the reduced highway congestion. Two is there has been a real savings in gasoline not consumed as a result of individuals taking the train. There has been a reduction in air pollution as a result of trips not being made by automobile. This area has a problem with air pollution. We are EPA sanctioned, which further limits our ability to improve.

We have access to an employment market in downtown Chicago that may be really denied to some without train service being available. For example, our average rider is a single female, approximately 25 to 26 years old, who is earning somewhere in the neighborhood of $26,000 a year. Without an efficient rail system into that employment market, many of our residents here may be denied that type of employment.

What is important to us overall and nationally is the concept of a healthy functioning alternate transportation mode, alternate other than highway in our case. We have seen shocks to the system in petroleum prices that we really can't predict what's going to happen in the future, so it is important for us to maintain this infrastructure and develop it so that it's there and available in the event that things get worse.

We understand certainly in Washington the budget pressure is very difficult with all of you. There are ominous clouds on the horizon with respect to the sequestering of funds or Gramm-Rudman type of cuts, but we know that our highway system is not working efficiently, that there is congestion, excessive consumption of petroleum-based fuels and air pollution. We would like to continue to provide solutions that are available through the UMTA budget.

I know that certainly in your area it's hard to imagine that a metropolitan area like Los Angeles has, through its growth pattern in the last 30 years, has developed without a rail system. Now we see a dramatic turn around in your area with heavy rail systems as well. We are similar to that in that we are experiencing a lot of growth, and in order to have access into the City of Chicago and City of Chicago access out here efficiently, we think this rail system is especially crucial.

In particular, the overall funding to the State of Indiana and the UMTA budget, it is worth mentioning here that in 1981 we were receiving approximately $25 million for capital and operating assistance for the entire State. Now we're down to something like $21.5 million, an overall real reduction of $3.5 million. But when adjusted for inflation, it's something like a 42 percent reduction in purchasing power. So in order for us to develop the infrastructure that we have all talked about here this morning, we see a real decrease in funding and yet increased responsibilities through the ADA Act, the possibility of a Clean Air Bill that's coming up on your agenda further this year. So we think we're unique in this industry by seeing increased responsibilities and decreased funding.

I would add that, in particular, we have a couple of legislative issues that are crucial to us in the Surface Transportation Act. Northwest Indiana is part of the Chicago urbanized area, and as large cities advocate their policy on the UMTA budget, whether it's operating or capital assistance, we become part of that larger urbanized area policy. For example, large cities through the years have increased their local funding for operating the systems, whereas I think only six percent in the case of large cities are UMTA funding for operating assistance. In our case, 30 percent of our budgets for operating are UMTA assistance. So in northwest Indiana in particular, if the large cities are successful in eliminating operating assistance for more capital assistance, we're sort of automatically locked into that policy because we're in the Chicago UZA. That may not be in the long-term interest of northwest Indiana. Certainly it isn't right now.

We also make a pleading for some degree of coherency in the Federal legislation with UMTA, particularly 13(c) labor agreements that are required as a result of receiving Federal assistance. It doesn't make a lot of sense to us to receive Federal operating assistance which guarantees the continuation of a system, at the same time signing these agreements that provide long-term liabilities for reductions in force of employees. It's logical to have 13(c) agreements where there are capital facilities that may—for example, a ticket agent, putting in a ticket machine, those types of issues for labor agreements make a lot of sense. But in the operating world, where we're trying to receive funding for salaries and fringes, we're still signing those agreements. So we wonder, in the long term, if those are really necessary.

I know your time is limited today. I will just comment on those two issues in particular and let Mr. MacKenzie continue.

[The prepared statement of Gerald Hanas appears on p. 1971.]

The Chairman. Mr. MacKenzie.

Mr. MacKenzie. Mr. Chairman, I want to thank you for this opportunity. We are delighted to see you in northwest Indiana, and we're delighted to see our local Congressman, Congressman Visclosky, here today.

I am in a unique position of the general manager of a small manufacturing business in northwest Indiana, who does national distribution, uses our expressways and freight systems to get its product in all of our 48 contiguous States, and my role in transit in northwest Indiana is strictly on a voluntary basis. I find myself the chairman of our transit finance committee, which is a unique committee, in which I am a nonvoting chairman. There are five other participants who all vote, and they must be unanimous in their vote for the distribution of section 9 funds. You can imagine, with decreased funds, some of the problems that are involved in us reaching a conclusion in the distribution of section 9 funds in northwest Indiana.

I have given you written testimony that pretty much covers the pertinent issues, including the statistical facts on the number of vehicles and passengers and our needs in northwest Indiana. On one of my trips to Washington I spent some time listening to the transportation plan as formulated by Mr. Skinner's department. I include in my testimony this Transit 2000 plan. I suggest to you that I can't see how anything I would say would add more succinctly to what the national transportation problems are than what is incorporated in this executive report on Transit 2000. I thought it was outstanding. I think it is not only true today but I think it's going to be more and more true as time goes along.

I congratulate you for your approach to these hearings. I have some personal viewpoints that I would like to convey to you today. One has to do with the funding issue. You have been involved in this process for many, many years, and if you go back to the original planning that was done and the political considerations of how you fund the interstate system, five cents a gallon on 22 or 23 cent gasoline, it was an enormous problem, with enormous discussions, and it was almost unbelievable that it got done. If you take that five cents a gallon in terms of 1950 dollars and put it in terms of the 1990 dollar, and you look at the problems concerning fuel and energy, it seems almost inconceivable to me that the funding for transit problems is not related to the energy problems. That should be a source of revenue. That's a personal opinion and observation.

I was recently in Canada. I have been on the continent. Almost every place I go, where I put a gallon of gasoline in, those costs are reflected except here in the U.S.

That's the end of my statement.

[The prepared statement of Colin MacKenzie, with attachment, appears on p. 1984.]

The CHAIRMAN. First let me let you know that Pete Visclosky is recognized as a champion for public transit, wherein he works tirelessly for better transit. I want you to know he does that. I suppose I could suggest a demonstration project. We used to have quite a few in the old days and we don't get them so much any more. We can still fight for them——

Mr. VISCLOSKY. We could talk about that, Mr. Chairman.

The CHAIRMAN. Okay. Do you have any questions you want to ask?

Mr. VISCLOSKY. I do, Mr. Chairman.

Colin, the first thing I would like to do is thank you for putting the debate about a gasoline tax increase in its proper perspective.

We look back over the events of the last several months and, of course, we certainly can't anticipate in the end what happens at the meetings taking place at Andrews Air Force Base. But the idea, now that the crisis we face in the Gulf is going to be a prohibition in terms of any increase in the gasoline tax, I find disquieting.

In the end, I certainly recognize publicly that a gasoline tax is regressive. As a general principle, I don't care for their imposition. But obviously, now it's a part of the structure in terms of how we provide this for a dedicated service. I do appreciate the fact that you put it in a very clear perspective, in terms of your reference back to the initial tax.

You do, in your prepared testimony, indicate support not only for a spend down in the trust fund—and the Chairman has certainly talked about that earlier in his remarks—but also a potential increase. I wondered, first of all, without unduly trying to put you on the spot, Mr. Hanas, what your general sense is in terms of that revenue flow from the Federal Government. You talked also as well about the predictability of funding.

Mr. HANAS. We look to a national basis, for some policy there. The American Public Transit Association has done a lot of research on this issue. In the Transit 2000 report that Mr. MacKenzie referred to, it puts a lot of that in perspective. What they have simply said is that there's a grave inequity with the public transportation funding, where we have some dedicated gas tax funding, that it is now being locked up to pass off against the Federal budget. We see that the infrastructure needs are growing and growing.

Again, the highway system isn't working with the congestion and air pollution, but in order for us to really get off the mark and develop some of these systems, they are capital intensive, a lot of them, and you need capital funding to get started. If the Federal Government is not the initiator or leader of that movement, I think very little will get done.

Mr. VISCLOSKY. Let me ask as a follow up, in terms of the gasoline tax, let's assume a proposal is made—and it has been made; it's not an assumption—that you have an increase in the tax but that it's used for general deficit reduction. What is your position regarding that particular proposal?

Mr. MACKENZIE. What you're saying is an increase in tax to reduce the deficit?

Mr. VISCLOSKY. An increase in the gasoline tax but it would not be used for transit purposes; it would be used for general budgetary purposes.

Mr. HANAS. I think that would almost be like a breach of promise, in the sense that here we've had a part of the gas tax at least theoretically dedicated to public transportation. It is now sort of impounded or locked up. We're talking about a potential increase of a user tax and there is no parity in the system. We have a free highway system, in essence. I mean, the toll road is a good example. It's just an artificial inducement for people using the Borman Expressway because there's no toll there. I mean, if there was some balance, you could relieve some real congestion and air pollution problems.

The gas tax, as we have seen it through APTA, look at the prices in Europe or Japan. They are tremendously higher. We need that kind of tax support to be able to find real solutions to some of these problems, such as congestion and air pollution. To use the user tax, per se, and then put it in the general fund, I don't think is getting the job done.

Mr. **Visclosky**. If I might cover one other issue, that is corridor preservation. There has been a change, in terms of the psychology, in northwest Indiana, looking towards the future, looking to recapture lakeshore areas, for example, and looking ahead in terms of the development of an additional rapid transit line.

Would either of you comment on some of the earlier testimony, the discussion we had in terms of giving you greater opportunities prospectively to potentially preserved corridors?

Mr. **Hanas**. We find that to be a problem as well, especially for a rail system. It takes an eight-year development cycle, as Mr. Ranfranz commented, on highways. It's not unrealistic for a transit corridor, either. It is a real problem. As the corridors become available, largely from abandoned rail lines, when they become available, there's a long procedure there of abandonment through the Interstate Commerce Commission that one goes through. But right after that, the corridors can be chopped up An overriding authority, or at least some Federal legislation that would allow to put a damper on development for a certain period of time would really be helpful, because you cannot respond as quickly. The West Lake corridor, for example, there is potential there for that to be sold. We have not reached an amicable agreement with CSX on a long-term lease. While we don't think there's anybody that's going to buy it from a market point of view, it really would help to say, "Listen, this is a transportation corridor and it has to be preserved as such."

There are many of those corridors now that are lost, and to go back into eminent domain proceedings or whatever is extremely expensive and very backwards.

Mr. **MacKenzie**. Some method of preserving those corridors, you just have to do it. You can't abandon that type of potential for public transportation. The costs involved, it is only a fraction of what it would be if you go down the line 20 years and have to go back to eminent domain.

The two corridors that we're really talking about are preservation of service of the Valparaiso Line, of course, and then the West Lake. It doesn't make any sense not to preserve both of those.

I envision that 20 years from now you're going to be in a situation where the mode of transportation has got to change. It will change. Twenty years from now, the oil situation, you're going to be in terrible circumstances. Somehow or other, in the process of doing what we do in transportation planning, we need to be projecting.

The allocation of resources, dollars and leadership, to get that done is vital. We're talking about two transportation lines, the one from Valparaiso and the West Lake corridor. They are absolutely vital to what goes on in northwest Indiana.

Mr. **Visclosky**. One more point, Mr. Chairman.

Mr. Hanas, we talked earlier about the preservation of the Amtrak line. While you don't have any immediate direct responsibility, obviously one of the options we're going to be pursuing as of today in the Congress is some type of mandate that Amtrak continue operation of that service for a period of six months.

If the service discontinues at the end of this year, what is your observation in terms of the additional problems we might face locally, both monetarily as well as the individuals who depend upon it, if we don't simply bridge that six-month gap and allow the service to terminate temporarily?

Mr. **Hanas**. We have within the South Shore an alternate rail system that one could argue that could pick up those additional people. But as testified here earlier, because of the success of our service and reliability of equipment, our peak hour service now is like 120 percent capacity. We have many more riders than we do seats, and unfortunately, if the Valparaiso service were terminated, that would add substantially probably to the peak hour problem that we face now. So our ability to move those people on an alternate rail line is just not there. We don't have the capacity.

The destination is important, too, as far as downtown Chicago. If it were terminated, I'm afraid those individuals would have very little choice but to hit the highways and try to go down town or displace other riders on the South Shore and put them out of a seat. We have really crush load conditions, where we just can't accept more people. So I think it would be devastating, at least in the short run, not to continue that for six more months while the study goes on and determine other options.

Mr. **Visclosky**. Mr. Chairman, thank you very much.

The **Chairman**. I just wonder, now that you consider the costs involved to solve the transportation problems in northwest Indiana, how do you see the financial burden being shared by the Federal, the State and the local governments?

Mr. **MacKenzie**. That's a problem. We've had a problem for five or six years in which we have been long on capital dollars and short on operating dollars, in terms of section 9 funds. We have, of course, pursued very vigorously trying to be able to utilize all the section 9 funds that do come to northwest Indiana.

We have been forced to share with Illinois capital dollars in order to get operating dollars back. Part of it has to do with the type of funding that's taking place on the South Shore Railroad, where Federal grants paid for cars that they needed. So their need for capital dollars is not as extreme. It allowed us to get more done in other systems in northwest Indiana, including a new pair of transit systems.

We would urge that you give flexibility in those dollars because what's true in northwest Indiana is not true in Chicago. When you fix the split between the operating and capital dollars, you sometimes penalize areas who would be able to provide better service and more viable service to their areas for no more dollars. That is certainly true of us in northwest Indiana.

Let me go on and answer the question a little more. We have been working vigorously to get local support not only from the three counties involved in our systems in northwest Indiana but also from the State of Indiana. I have a valuable little slogan that I say, that "I hate to give money to Illinois." In fact, that is one of the things we've been doing because we have no provision for local operating assistance within the State of Indiana. It's something that were doing something about. It's one of the things that is in our agenda in Bootstrap.

Mr. HANAS. Mr. Chairman, I think we have long recognized the decreasing Federal budget in transportation. As I said before, in Indiana it's been a 42 percent real reduction in ten years in purchasing power. What we think is fair, though, is a stabilization to maybe a 50/50 basis on capital funds, so that at least we have some long-term basis and some predictability, when we have local funding, that some Federal funding will be there. We could start to move these relatively capital intensive projects such as rail, as you have seen in Los Angeles, forward, because they are expensive.

The CHAIRMAN. We're looking for ideas. I know in part of my area we got to the point where we needed some money to build a highway but we didn't see where it was solely our responsibility. So we made a deal with the developer that he would put toll roads on two of them and collect tolls to help us raise the money to build it, and then, hopefully, he will develop his area enough to come out all right. This was adding a fourth person, the individual builder himself, to come up. He was going to finance much of it himself to start, but then help the difference by putting tolls on the two roads. We're going to see how it works out. So we're trying different things in different areas.

Of course, you are aware that in our case in California we do need highways out there. We seem to need them all the time. So this last time we put an additional nine cents on the ballot that the people of California are collecting themselves, just to build up a separate fund in addition to what we do. So when it comes to matching money, at least they will have a source for getting the matching money. These little different things are being tried all over. It's kind of good to at least hear what people are thinking.

Mr. MACKENZIE. Well, we're covered in northwest Indiana by our geographic location, particularly in this area, because of not only the steel industry but also the tremendous flow of transportation that goes through our area to Illinois, Michigan and Ohio. Our Borman Expressway reflects that.

The CHAIRMAN. Anything further?

Mr. VISCLOSKY. No, Mr. Chairman.

The CHAIRMAN. Thank you very, very much for your presentation.

Our next panel will address the economic development issues. The witnesses are Mr. Dewey Pearman, Vice President of Governmental and Legislative Affairs, Northwest Indiana Forum, and Mr. Jerry Lee, Secretary Treasurer of the Laborers' International Union, Indiana District.

I understand Mr. Lee is not here. Mr. Pearman, you might as well begin then.

TESTIMONY OF DEWEY F. PEARMAN, VICE PRESIDENT, GOVERNMENTAL AND LEGISLATIVE AFFAIRS, NORTHWEST INDIANA FORUM, INC.

Mr. PEARMAN. I'll be a panel of one, then.

Thank you, Mr. Chairman. My name is Dewey Pearman of the Northwest Indiana Forum. I am vice president of Governmental and Legislative Affairs. Our president, Charles Oberlie, had been scheduled to testify here today. Chuck is unable to be with us and he has asked me to send his regrets for not being here.

So that you understand the perspective from which we comment on this issue, allow me to spend just a brief moment describing our organization to you.

The Northwest Indiana Forum is a regional economic development organization working in Lake, Porter and LaPorte Counties, IN. We are a coalition of the private and public leadership of northwest Indiana. Our mission is to turn the assets of northwest Indiana into a competitive advantage that will encourage stable, balanced, and steady economic growth. Working together with local businesses, the Forum strives to make this competitive advantage known to those with potential to expand and relocate into northwest Indiana.

Mr. Chairman, pursuit of this mission requires us to understand the very important relationship between sound public policy, particularly with respect to the adequate financing of public infrastructure, and the ability of communities to stimulate private capital investment. The Northwest Indiana Forum is on the front line of the economic development process in the region.

Our staff of economic development professionals work on a daily basis with local companies considering making major capital investments in plant and equipment in northwest Indiana. As we work with those companies, we very often hear their expression of concerns for the ability of the local transportation infrastructure to support the needs of business.

We believe there to be a very strong and direct relationship between the quality of roads and highways, the quantity and quality of mass transportation systems, and the ability of communities to retain and stimulate private capital investment in plant and equipment. We believe this is a relationship the business and governmental leadership of northwest Indiana fully understands.

Several months ago we undertook a survey of our membership to help us determine our public affairs priorities. The results of that survey clearly demonstrate that our membership is acutely concerned with the issues being considered by your committee today. Based on the results of this study, we have identified the adequate financing of transportation infrastructure, including roads and highways and mass transit, to be our very top public affairs priorities.

As such, we have initiated along with the Northwestern Indiana Regional Planning Commission in an effort to identify a major new funding source for these types of projects. That effort, Operation Bootstrap, mentioned by many previous speakers today, is being directed by a public/private, nonpartisan task force which is in the process of developing a proposal for addressing local infrastructure needs. We believe this task force will, in the next several weeks, finalize a series of recommendations which will include the imposition of a tax on a three-county basis to address public infrastructure and allow local units of government, cities, towns and counties to finance road and highway projects and mass transit operations.

Our support for a tax increase is demonstrative of our concern for additional financing in these areas and a recognition of limited State and Federal resources. We believe such initiatives are becoming critically important to the economic future of our community. However, our intent in encouraging greater local effort is not to replace existing State and Federal funding but rather to make northwest Indiana more competitive in attracting funds from other sources.

We locally are willing to do our part to enhance northwest Indiana's ability to attract private capital investment, but we fully expect the State and Federal governments to be partners in this effort.

We fully appreciate the pressure being placed on the Federal Government's budget and the need for significant budget reductions. But our experience in working with companies making capital investment decisions tell us that private investment often hinges on public investment, particularly in roads and highways and public transportation systems. We believe the kind of public infrastructure investment that stimulates private capital investment exists in northwest Indiana.

You have heard many references here today to the Gary Airport project, the Borman Expressway congestion relief study, the commuter rail opportunities both with regard to the existing operations and the proposed operation of the West Lake corridor and the proposed Amtrak continuation. We believe these are investments that the business community will respond favorably to. They are the kind of investments which will stimulate long-term capital investment in northwest Indiana and job creation.

With that, let me thank you for allowing us to present our comments on this proposal.

[The prepared statement of Dewey F. Pearman appears on p. 2007.]

The CHAIRMAN. Thank you, Mr. Pearman.

I have one question here. In order to attract new industry, it often requires beefing up existing infrastructure or offering some other type of incentive.

Are potential new businesses coming to look at the area with some kind of infrastructure "shopping list", and have you been able to respond to their requests?

Mr. PEARMAN. The kind of infrastructure needs that have been expressed to us by companies that are looking in this area—and we think there are a significant number of companies doing that—relate most directly to transportation and sanitary operations. Transportation is probably the foremost concern both with respect to the existing infrastructure and the ability of local units of government, along with the State and Federal Government, to put new transportation facilities into place.

We very often hear from companies looking at some of the older urban areas, that the local streets and highways need attention, and that the sanitary district operations of those communities need renewed plant and equipment.

The **Chairman**. Mr. Visclosky?

Mr. **Visclosky**. Mr. Chairman, no questions really, except to thank Mr. Pearman for pointing out two things. One, the relationship between infrastructure and investment which, in and of itself, is sort of nebulous and useless unless we apply it then to the movement of people and goods. I think the fact that you have again brought out the relationship in terms of increased productivity and capital investment is important.

I think the other thing, not to beat a dead horse, is the fact that again, in northwest Indiana, we're willing to help ourselves, to impose additional burdens upon ourselves, to we're looking to ensure that the Federal Government doesn't abdicate its responsibilities during the reauthorization process. Again, I think it's beneficial that the Chairman understand we're not asking for the status quo. We are simply looking to make sure we don't regress and that some improvement here is made because we're willing to do it for ourselves. I appreciate that.

Mr. **Pearman**. Thank you, Mr. Chairman.

The **Chairman**. Thank you very much, Mr. Pearman.

Our next witness is Mr. Rick Cockrum, Executive Director of the Association of Indiana Counties. Mr. Cockrum, the floor is yours.

TESTIMONY OF RICHARD J. COCKRUM, EXECUTIVE DIRECTOR, ASSOCIATION OF INDIANA COUNTIES

Mr. **Cockrum**. Thank you, Mr. Chairman. I certainly want to concur with your opening statements on the woes of our infrastructure in our country, and speaking on behalf of county government in Indiana on the problems we have had in Indiana, I want to thank you for the ability to speak to you today.

County government in Indiana is responsible for 66,000 miles of road, or 72.5 percent of the total miles in the State. These road miles serve as a critical link between most Hoosiers and their ability to maintain a healthy economic existence. The 66,000 miles of county roads carry 27 percent of the State's traffic.

In addition, Indiana counties are responsible for over 12,000 bridges, of which over 6,000 need to be rehabilitated or replaced. According to a study by the Road Information Program in 1989, traffic on Indiana's county roads has increased by 35 percent in the past three years, and is expected to double by the year 2000. The same study shows that over 28,000 of the 46,000 miles of paved county roads are substandard and in need of major repair, including resurfacing and reconstruction.

Our Nation's transportation system surely qualifies as one of the most critical areas for intergovernmental cooperation. It is counterproductive to view our surface transportation network as separate Federal, State and local components. To better serve the needs of the people paying for the system, we must recognize it as one complex integrated system.

The roles of the three levels of government have been mixed and, with the near completion of the Interstate Highway System, we have the opportunity to address some problems of the past.

The Federal role in highway funding is critical, but consider the following: 79 percent of all rural and 74 percent of all urban roads in the United States are not eligible for Federal aid. Federal highway funds coming to Indiana have decreased by 17 percent from 1985 to 1990.

From 1956 to 1988, Indiana received 75 cents in Federal highway aid for every dollar we sent to Washington. With the enactment of the 85 percent minimum allocation formula, we have fared much better, but it is hardly a bargain to send someone a dollar and get back 85 cents.

Local units of government and the State have taken aggressive roles in addressing this crisis. The State, over the past decade, has raised motor fuel taxes several times, and local governments have imposed numerous local option taxes. In fact, 75 of our 92 counties now impose a local income tax. Almost half of them have been adopted the new tax within the past five years, with highway funding being one of the driving forces behind the adoption. Still, with the increase in cost of materials and labor, and the decrease in Federal assistance in all program areas, we have not been able to properly maintain our existing system, let alone build new roads.

One of the most frustrating experience of a county commissioner in Indiana is to use Federal funds for a transportation project. The strings and red tape attached to a Federal dollar are enough to have many counties forego a Federal aid project. It is highly unfortunate that a typical Federal aid bridge project will take four years to complete. Sometimes as equally intimidating is the local match requirement. Many counties do not apply for Federal highway assistance because they do not have the local funds to meet their share of the match.

As disturbing as the low return on Federal dollars for roads is, it is nothing compared to mass transit funds. For the period of 1984 to 1989, Indiana received 21 cents for mass transit dollars for every dollar we sent. Hoosiers are known for their independence and self reliance. Perhaps that is why we have one of the highest per capita vehicle usage rates. But it is inevitable, with air quality problems, urban congestion and suburban mobility, that we must rely more on mass transit in our State. To do so, we should be receiving a larger share of Federal mass transit funds.

In conclusion, the Association of Indiana Counties recommends the following seven points:

One, the minimum distribution to donor States be increased. This can be done by either raising the 85 percent minimum allocation or adjusting the current distribution formula.

Two, a maximum amount of flexibility be granted to States and localities for use of Federal highway funds. This can be accomplished through a block grant type program or reducing restrictions in the Federal statute or regulations.

Congressman Visclosky mentioned a point earlier about the increase in flexibility. I think it's safe to say on behalf of our members that that increased flexibility is important, but not if it's tied in with a decrease in Federal funds.

Number three, the Highway Trust Fund should be spent down to a reasonable balance and not be used as a ploy to show a reduced budget deficit.

Four, Congress should avoid increasing motor fuel taxes to reduce the Federal deficit.

Five, there should be no change in the formula to favor States over local governments.

Six, a minimum allocation should be established for mass transit funding. Mass transit funds should also have maximum flexibility.

Seven, Congress should oppose increasing State and local governments' share on projects that require matching funds.

I will certainly answer any questions or expand on any comments.

[The prepared statement of Richard J. Cockrum appears on p. 1967.]

Mr. VISCLOSKY [presiding]. Mr. Cockrum, I appreciate your time and commitment, as well as the preparation of your testimony. I do have a number of questions.

The first is, what are some of the plans that counties in Indiana have proposed or are working on to improve their infrastructure, particularly in terms of finding alternative means of transportation?

Mr. COCKRUM. One of the things that we've been fairly successful with in our own State legislature in the last several years, we have targeted two areas in infrastructure. One is increased funding from the State itself, obviously, and second is increasing flexibility in what money we have, as well as increasing our own flexibility in raising that money.

We have, for example, three income taxes in the State. One is for property tax replacement, one is generally used for operating, but the third one is the county economic development income tax, which some 15 counties have enacted in the last two years, to dedicate the money for an economic development project or for any capital projects. So we have had counties, for example, that have passed an income tax to pay for the county jail or to pay for a bypass. We have also some counties investigating a new statute that we had enacted in allowing a multiple county infrastructure authority, to go together to finance.

We had several counties enact a local option wheel tax. Some have adopted a food and beverage tax for capital projects. I believe Vanderburgh County paid for their airport rehabilitation on a food and beverage tax. So there's a lot of options out there. There are 92 ways of paying for it, and there has been a number of different combinations used.

Clearly, there has been an effort made at the local level to accept some of that responsibility that has been discussed here today.

Mr. VISCLOSKY. I think you have covered some of the questions the Chairman also had, in terms of what are some of the local financing mechanisms that counties are looking at for capital projects, and I think you've addressed that.

One of the other questions I would have is, in terms of the recommendations you made to the committee, in point six you mentioned that there should be a minimum allocation established for mass transit funding. I would ask, in terms of relativeness, where mass transit today stands with the Highway Trust Fund. Would you be looking for essentially the same proportional allocation, or would you hope, from your perspective, that mass transit have a higher ratio?

Mr. **Cockrum**. I would think that it's fair to start out asking for a dollar for dollar return. I don't think politically that's going to be possible. The reason the discrepancy is so broad—I mentioned we were getting 21 cents on the dollar. The same source of the figure for that showed New York getting $2.70 for every dollar sent in. So I don't think it's going to be politically feasible to see a massive shift in that distribution. But as we address the problems of donor States by going to at least an 85 percent minimum allocation for highways, there should be some compromise figure that could be worked out for a minimum allocation return to States for mass transit. I don't have a suggestion on what that figure should be. Obviously, the fairest would be a dollar for dollar, but that's probably not possible.

Mr. **Visclosky**. Do you think the needs are comparable in terms of the rural areas versus the urban areas, in terms of the return on the dollar paid?

Mr. **Cockrum**. For mass transit?

Mr. **Visclosky**. Also, I guess, the other side of that is the ability to provide a transportation alternative on a cost basis, the cost potentially being higher in some of these urban areas.

Mr. **Cockrum**. Well, I don't profess to be a transportation engineer, but I would suggest that—obviously, the costs are going to be higher on a per person usage. The demand for services is just not there.

The question of a rural county, the demand for services, although we have mass transit in the sense that we're using rural busing services, particularly for the elderly and low income in some of the rural areas, but not in the traditional sense that we think of mass transit.

Mr. **Visclosky**. Mr. Cockrum, thank you very much.

The **Chairman** [presiding]. Thank you, Mr. Cockrum.

You did ask my questions?

Mr. **Visclosky**. Yes.

The **Chairman**. Very good.

Our last panel today is Mr. Rudy Kapitan from Merrillville, IN, and Mr. Terry Kleban from Crown Point, IN. You're first on the list here, Mr. Kapitan, so let's do it that way.

TESTIMONY OF RUDOLPH F. KAPITAN, PRESIDENT, CITIZENS AGAINST RAILROAD SLAUGHTER, INC.; TERRY J. KLEBAN, CROWN POINT, IN

Mr. **Kapitan**. Thank you, Mr. Chairman. As you indicated, by name is Rudy Kapitan. I live in Merrillville, IN. I am one of the founders of CARRS, Citizens Against Railroad Slaughter.

We are all aware of the fact that from the moment we are born, society takes great care and exerts much effort to protect, promote and to preserve life. This is manifest by the workings within our medical community, within industry and the sciences. Man's primary instinct is to preserve himself.

There is, however, a force, a system in our land which counters those basic aspirations geared to promote and protect life. That system is the railroad industry in the United States. For too long, they have been allowed to continue in their callous disregard of our rights as they take from us our lives, our limbs, our properties, and our peace of mind. Each year, thousands of families are ravished by nightmares caused by a federally-protected, irresponsible railroad system.

Gentlemen of the committee, if you're looking for these comments, what I have done—my written testimony would take approximately 20 minutes. As a result, I was informed that five minutes would be allocated and I capsulized all that information into approximately a five-minute presentation. That's the reason why, if you're looking through this, it's an abbreviation of the 20 minutes you have there.

In my hand I have a copy of a death certificate. That death certificate is of my 30 year old son, Rudy J. Kapitan, who was killed at the Grant Trunk's Hendricks Street crossing in Merrillville while returning from church early Sunday morning, November 6, 1988. No gates or lights warned him of the hazardous crossing which he was approaching.

It was at this crossing that Julie Rothenberg was killed in 1987, and where in 1986 Frank Razmus was killed. Three fatalities in less than 30 months, to say nothing of many other accidents at that infamous crossing.

State statute mandates that the railroads are responsible to afford security for life and property of persons and vehicles using the public highways. The hazardous crossing which the Grant Trunk allowed to exist at the Hendricks Street crossing couldn't be a more flagrant violation of that statute. It typifies the railroads callous disregard for what most of us hold sacred, life itself.

Overwhelmed by grief, I began a search which led me to uncover shocking rail-highway crossing statistics. Of all the States in the Union, Indiana, although ranking 15th in population and 34th in land area, ranks first in total fatalities caused by passenger trains, second in total casualties, and third in total fatalities at rail-highway crossings. One of every 12 fatalities in all of the United States happens in Indiana. It is in Indiana that we also find the most uncontrolled crossings in all of the United States. Of the 7,744 rail-highway crossings in Indiana, only 967 are protected by gates and lights. Eighty-eight percent are not.

Given these appalling statistics, can we say that Hoosiers' rights are adequately protected at rail-highway crossings? They are not. Funding must be made available to correct these scandalous defects.

To place the blame for these statistics on the Indiana motorist, as the FRA and the railroads do, is an affront to our intelligence. I submit that when you or I fail to be 100 percent attentive to the demands placed on us as highway users, we are only human. Should we be condemned to death because of the momentary misdirection of attention? Should not the extreme hazard of a megaton train, speeding along at and up to a permitted 110 miles per hour, be unmistakenly marked as extremely hazardous?

For me to do nothing, given these depressing statistics, would be to condone the tragedies caused by a federally-protected railroad system. So not long after my son Rudy's death, we formed an organization and we called it CARRS, Citizens Against Railroad Slaughter. Six objectives were espoused and they are contained in my written testimony.

Federal legislation which is geared to protect the hazards created by railroads must change. For example, the U.S. Code prohibits the release of information compiled by railroads for identifying, evaluating or planning safety enhancements of potential accident sites or hazardous rail-highway crossings. So the Grand Trunk continued to maintain a hazardous crossing at Hendricks Street where my son Rudy was killed, despite the fact that the FRA and the railroads knew very well of that hazard.

I have a copy of such a contraband report, which is protected from disclosure by the U.S. Code. It is a Hazard Index for the Dogwood crossing near Fort Wayne. Bob Savage was killed at that crossing. His widow paid a private investigator several hundred dollars to get this particular report. To this day, because of Federal disclosure protection, no improvements have been made to the crossing, rating the most hazardous crossing in Marshall County. This type of Federal protectionism must stop.

Railway Age, in its November, 1989 issue, publishes past and proposed grade crossing outlays. The 1985 to 1987 average expenditures at crossings, apart from maintenance, totaled $520 million, of which 57 percent was supplied by Federal funds, 33 percent by State funds, and only 10 percent by the railroads. Estimated annual needs for public rail-highway crossings through the year 2005 total $853 million, of which only $8 million is projected as the railroads share. That must change.

Most of the rail-highway crossing safety related work is funded by section 130. It is the fate of this program, whose current authorization expires in 1991, that has railroad people worried. They are concerned not only about its renewal, but in what form it might be renewed. There is fear, for example, that the current 90 percent Federal and 10 percent local match formula might be revised. That's exactly what we need, changes in that match formula. The architects of a new national transportation policy must include voices such as mine so that long overdue railroad improprieties will be corrected.

There is much public outcry regarding the savings and loan scandal and the bailout at taxpayers' expense. We have had a railroad bailout scandal for years and year. That scandal has not been addressed. It's time to do so.

Mr. Chairman, we in Indiana encourage travelers to "Wander Indiana". As a matter of fact, we had that slogan on all of our license plates last year in Indiana. However, I am reminded to say that as we encourage those travelers to travel and wander Indiana, we should warn them that their chances of getting killed or injured at Indiana rail-highway crossings are better in our State than in any other State in the Union.

Rail-highway crossings are an integral part of surface transportation. Problems which exist must be recognized and funding must be allocated to correct the serious defects at these crossings, not only in northwest Indiana but throughout our State.

CARRS invites your individual and collective assistance to encourage funding need to promote safety, which is lacking, at our rail-highway crossings.

My special thanks to Congressman Visclosky and his legislative director, Robert Falb, for incorporating rail-highway safety as a topic for discussion at this hearing, and thank you for asking me to be a participant.

[The prepared statement of Rudolph Kapitan appears on p. 1976.]

The **CHAIRMAN**. Mr. Kapitan, the Committee has heard that as the rail-highway grade crossing program matures and we have now addressed the most dangerous crossings, the program is no longer cost effective. Your testimony, to the contrary, is most compelling and sobering. We thank you for it very much.

Do you have any comments?

Mr. **VISCLOSKY**. Mr. Chairman, I do. I appreciate the fact that you have allowed Mr. Kapitan the opportunity to testify.

He approached me at a public forum we held in Merrillville approximately a month and a half ago, if I recall correctly, to indicate his concern. Now, I indicated to him that I had clipped a number of articles regarding not just his activities but the tragic circumstances involving the death of his son. As I indicated then, while I have had a personal experience similar to his, without the consequences attached to it, I had to take his observations to heart. It was in 1977 that my mother was the driver of a car that was struck by a train. She survived the incident, but I appreciate, to a very limited degree, the grief that Mr. Kapitan has experienced. The fact that again you have taken a very negative event and tried to act positively on it bodes well in terms of your dedication.

As the Chairman indicated, from a statistical standpoint, a national average standpoint, an economic standpoint, some might suggest that the program is no longer cost effective. Obviously you have pointed out to us in a very telling manner that that's not necessarily true. I appreciate you taking a day of your time as well to wait very patiently to provide the testimony to us.

Mr. **KAPITAN**. Thank you very much.

The **CHAIRMAN**. Mr. Kleban.

Mr. **KLEBAN**. Mr. Chairman, Mr. Visclosky, I am testifying before this committee in hopes that something can be done to alleviate the congestion on the Borman and the surrounding expressways and toll roads throughout northwest Indiana.

I am a professional driver. I have logged over 1.25 million accident-free miles for Union Carbide. I'm a frequent traveler, traveling the connecting interstate systems throughout the metropolitan area. I am constantly amazed about the number of commuters and commercial traffic that we have on the Borman and I–65 and all the other connecting highways.

Driving to or from Chicago, drivers have three alternatives. They can either travel the Skyway, which is I–90 and connects with the Indiana Toll Road, or they can take the Kingery and the Calumet and the Borman from the State line, or they can take the Tri-State, which is I–294, and make a circuitous route around Chicago to their destination.

If the Indiana Toll Road and the Skyway is utilized, drivers constantly encounter rough pavement and a perpetually closed lane in either direction. This is also combined with an excessively high toll. Commercial vehicles going to and from the heavy industrial centers in northwest Indiana served by the Toll Road and Skyway feel the brunt of this regressive and cost-prohibitive toll in utilizing the only viable means of access to the Chicago markets. If people to go through the city on the Borman and Kingery and Calumet Expressways, then delays are encountered because of oversaturation during peak commuter times and ongoing construction and maintenance. If the Tri-State is utilized, then one can expect toll collection barriers every 12 to 15 miles, also causing massive delays. As you can readily see, Mr. Chairman, this is not the most energy efficient way to conduct business.

It has been said that the 15 miles between the State line to the Indiana Toll Road, going from west to east, is one of the most heavily and densely populated with commuter traffic and commercial traffic throughout the United States with three lanes in each direction dumping into I-65, I-90 and I-94, plus all the other spur highways. Any time there is an accident or a lane restriction of any type, the system breaks down because of the highways feeding from one another.

Many times I have been forced to sit in stopped or slowed traffic upwards of 45 minutes to an hour. Since most drivers are paid a percentage or mileage, they are not compensated for the additional time added to their runs. The automobile commuters also are late for work or late in getting home to their families. This means lost productivity and delays.

My recommendations to this committee panel would include but not be limited to several of the following:

First, consideration of lowering the Skyway toll charge. Possibly this would ease some of the traffic off of Borman, possibly by 10 to 15 percent. Now, it doesn't sound like a tremendous percentage amount, but believe me, a reduction of any percentage would be well worth our time and effort to seriously consider it.

Second, an additional two lanes in both directions from the State line to the Indiana Toll Road, approximately 15 miles, would also alleviate part of the massive congestion.

If it was within my power and I had a magic wand, I would wave it and extend the Cline Avenue Expressway south from I-94, the Borman, and I would link up with a new bypass around Merrillville, extending it to Valparaiso. What we have is gridlock on U.S. 30 by the malls coming off of I-65. I would make this a limited access bypass.

You know, we have a problem, in that every time we construct a bypass, such as 49 extending from 94 to the Toll Road around Chesterton, we have a lot of businesses popping up along the bypass, creating massive gridlock again. We're defeating the purpose of the bypass.

The last recommendation I would have would be for the committee to seriously consider enticing commuters to park their vehicles, their privately owned vehicles, at convenient parking lots along the expressways. These people then would take commuter buses into the mills or into Chicago for their shopping sprees.

However, we have got to remember one thing. People, for the most part, that live in suburbia really are hesitant to take public transportation unless it's safe, well lit, on time, and economically feasible for them to do it. Combined with some of these other recommendations, I think maybe the traffic flow patterns that we encounter in northwest Indiana could be alleviated and resolved.

Thank you for your time, gentlemen.

[The prepared statement of Terry J. Kleban appears on p. 1982.]

The CHAIRMAN. Mr. Kleban, which route would you say cuts more deeply into your truck profits; paying the toll on the Chicago Skyway with less traffic, or the time lost and the wear and tear on your truck due to traffic congestion on the Borman?

Mr. KLEBAN. Personally, I would say that the Borman would cut into the company's profits more than the regressive toll on the Skyway. I personally do not pay the toll. The company picks up the toll, of course, for the drivers.

The CHAIRMAN. My district in Southern California actually centers on the ports of Los Angeles/Long Beach, in that area. I consider southern Los Angeles and the Orange County area kind of part of my district. A short time ago I was making speeches around, saying that in my little area there we would be growing by 3.5 million, so we had a problem as to how we could handle that. The officials in the southern part of the State, the Southern California area governments and the RTD and different ones, sent a little group back to advise me that it wasn't three-and-a-half but it was 5.5 million. So I changed my speech to 5.5 million, and it became roughly 7.5 million.

The congestion that came is something that we really don't know what to do about. I did do an extension freeway from Los Angeles, where we had to get our materials taken to the ports. Within six months it became the most highly traveled section of the Interstate System in the Nation.

A few weeks ago, seven big companies came from the area, four from the Port of Long Beach and three from the Port of LA, and they pointed out that even before we built the highway, just driving down city streets, they could make it down there in 45 minutes to an hour, normally, but now, with the new congestion, it was two-and-a-half to three-and-a-half hours. You know, I guess that's when you get millions of cars out there and the trucks can't get through.

I think they pay their truck drivers 25 bucks an hour. When you pay a guy 25 bucks an hour and it takes him two-and-a-half to three-and-a-half hours to do what he used to do in 45 minutes to an hour, they have to then add that cost on to the product they're selling. They said that I had to do something because they just can't compete with this congestion.

Well, that's the problem I have. I understand it's all over the country to different degrees. We have this congestion and it's something that is terribly expensive. I thought when I put the freeway in that it was going to be an answer. It so happens it has just attracted more cars and more people. So since then we've actually built a double-decked transit line. We had the opening here two weeks ago, called the Blue Line in Los Angeles. We're going to try to get people out of their cars into the transit so that we can have some room on this freeway for the trucks that have to go from the ports to the downtown industrial section.

I just want you to know we all have these problems all over the country. They are put together in little different ways is all. I can see where you could have a tremendously profitable operation, but I see where you could also have some of the same things we're having. Congestion could be a real problem there.

What I have seen here, as we flew in, you have so much development potential here, an awful lot of people could move in here in the next few years.

Mr. KLEBAN. Well, Mr. Chairman, the additional people moving in are not the problem. It's the transient population.

The CHAIRMAN. Well, I mean they all get in their cars and they will be going——

Mr. KLEBAN. From point A to point B. You have to realize that going to or from Detroit, Chicago, Indianapolis, going through northwest Indiana, we feed these metropolitan areas. We are actually bottlenecking the traffic. We're coming down into three lanes in each direction, coming to and from Chicago. The 15 miles, as I said earlier in my testimony, is probably, from the State line to the Indiana Toll Road, at Lake Station, East Gary, is probably the most densily traveled section of highway in the United States. So maybe we might want to seriously consider the additional lane addage on both sides, to and from.

The CHAIRMAN. We tried to solve it with a transit line. We're hoping that will do something about it. Now we have to get the people out of their cars on to the transit, which is tough. We're even doing publicity, as something they not only should do but something they will enjoy doing. We have some of our biggest name people, television shows, showing them on it, so they know it's something people ought to do.

Mr. KLEBAN. I hope it will work for you.

The CHAIRMAN. We don't know. We've got our fingers crossed. Mr. Visclosky.

Mr. VISCLOSKY. Just a couple of things.

Mr. Kleban, I thank you. I was going to ask whether the two lanes were on the Borman. I assume that was your point.

I would point out that since I've been a Member, one of the requests I have made of the State and Federal Highway Administrations was that as they design the reconstruction of the five major interchanges that have been examined over a period of years, that they do so to allow the possible future construction of an additional lane on each side. I don't again propose that that solves all of our transit problems, and I certainly don't represent the money is there today to do it. But again, I think if we would reconstruct those interchanges simply to accommodate a six-lane Borman Expressway, we really eliminate any future possibilities of action. I am pleased that they have taken that message to heart and will be doing that.

The second point I would make—and I would refer you to the Office of County Commissioners in Porter County—I had a conversation with one of the county commissioners this past Saturday and it's my recollection of the conversation the county, or some of the local subdivisions, have acted in Porter County to avoid the very concern you just expressed; that is, it is all fine and well to do a bypass around Valparaiso, potentially around Merrillville, and then essentially you end up right back in the same situation you find yourself in. It would appear, at this point at least, that the county government in Porter County has anticipated that. Whether they will follow through and whether I'm exactly correct in my recollection, I don't know.

I guess the last point I would raise is that I'm pleased that, as a professional driver and someone who is out there every day, you, to a large degree, have come to many of the same conclusions that public officials have and those who plan have. It would lead me to believe, as the last witness of our panels, that maybe we're on to something in terms of some of the ideas that have been expressed. You're out there every day, and I again appreciate your time and commitment to having been with us today.

The CHAIRMAN. Thank you.

I want to thank all who appeared here today for providing us with some excellent and pertinent testimony. It will be most helpful to us as we consider infrastructure policy programs and legislation.

Pete, I want to thank you for having the Committee here today. I believe the hearing has been most informative. Again, thank you. With that, the committee stands adjourned.

[Whereupon, at 2:20 p.m., the committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

TESTIMONY OF

THOMAS V. BARNES, MAYOR
CITY OF GARY, INDIANA
401 BROADWAY
GARY, INDIANA

Testimony Given Before the Committee on
Public Works and Transportation
September 17, 1990

Good morning. Thank you for the opportunity to address you concerning the surface transportation infrastructure needs in our area. Hopefully, my remarks will assist you during your deliberations on the reauthorization of the Surface Transportation Act.

First, I want to quickly state four overriding priorities the City of Gary shares with local governments across the nation. I hope that there will be movement to:

1. Restore the funding lost through the 1980's for highways and transit;

2. Remove federal barriers to state, local, and private sector participation in federally-funded projects;

3. Distribute funds on the basis of transportation needs, such as more funding for areas of high traffic congestion (urban areas) and not just high mileage (rural areas);

4. Create an urban/suburban program composed of the Federal-Aid Urban System, the urban/suburban portion of the federal aid primary system, and other smaller components.

But our needs in the entire area of surface transporation are many and broadly based. Unlike some issues, transportation touches the lives of every citizen in Northwest Indiana on a daily basis. How to travel from point A to point B is a concern that every citizen faces whether dealing with highways, streets and roads or public transit systems. And, increasingly, local government is being asked to pay a greater share in the cost of providing the means to travel, a share it cannot afford.

In the City of Gary, we are currently undertaking a significant road project - the widening of Grant Street - a major thoroughfare in the city. The project has been at least ten years in the making. While there have been many reasons for delay, one of the most important has been our inability to raise the local share of funding needed to match the federal dollars that have made the project possible. The amount of local funding needed for this project becomes insignificant when compared to proposals that have been circulating on a federal level which would change the federal share/local share ratio to increase the local share. If it has been difficult for the city to meet the requirements in 90/10 grant situations, a change to 75/25, for example, would prove to be almost an impossibility. If a 50/50 plan were implemented, our situation would become hopeless.

This financial difficulty is not limited to road projects. Public transit infrastructure is affected as well. The situation with the city's public transportation system, which provides bus service throughout the city, is just as dire. For the past four years, the operating budget allocated to Gary Public Transportation Corporation has decreased on a yearly basis by $250,000.00 to $300,000.00. For some time, we have been able to make ends meet by trading some of our capital dollars for Chicago's operating dollars, at a disportionate exchange I might add. We are now between the proverbial rock

-more-

and a hard place because our rolling stock is aging and we need our capital dollars making the chances for future bartering with Chicago slimmer.

We are not insensitive to the fact that the federal government cannot pay the entire transportation infrastructure bill. We have taken steps to assist ourselves. Gary is the only city in Northwest Indiana that has a property tax levied especially for financial support of its bus system. Further, in recent months, the communities of Northwest Indiana have banded together to try to develop new avenues to generate funds for infrastructure needs, including highways and public transit, through the Operation Bootstrap initiative. This initiative is still in the planning stages and would add a sales tax to certain items purchased in our community, to be utilized for infrastructure purposes. Clearly, then, we are not attempting to rely upon the federal government to meet all of our needs.

The dollars generated from local initiative, as well as those provided under the act, are of critical importance to Northwest Indiana's economic growth. These dollars provide the much needed means for localities to provide congestion free access to businesses. Good transportation infrastructure is also a proven element in attracting new businesses and spurring residential development, both of which are sorely needed to combat the lingering vestiges of the area's economic decline.

-more-

The reauthorization of the Surface Transportation Act, with no new and higher local funding ratios is critical to local governments' efforts to meet its transportation infrastructure requirements. New distribution formulas which call for flexibility in project fundability and allow highway projects and public transit to be funded from the same pool of monies are inappropriate in this scenario. This would only diminish already overtaxed resources and make local governments' plight even worse.

The Surface Transportation Act has been a source of financial assistance to local governments for some years now. It is my hope that it will be reauthorized and if changed at all, changed to increase assistance to cities.

Thank you for allowing me to address you.

###

GOVERNOR EVAN BAYH

Room 206 State House
Indianapolis, Indiana 46204

STATE OF INDIANA

Mr. Chairman, I am pleased to accept Congressman Visclosky's invitation to present testimony today on Indiana's transportation needs and concerns, particularly those of Northwest Indiana. Thank you for the opportunity, and welcome to Indiana.

Indiana is known as the "Crossroads of America" and for good reason, as several of the nation's transportation arteries criss-cross our state, especially here in the transportation hub of Northwest Indiana. The transportation system in Indiana, as well as the nation, itself is standing at an important crossroads as we are confronted with decisions on the future of our nation's transportation system. Our nation has a record of significant transportation accomplishments, but we now face new challenges. The course we take in the next year will largely determine how far, how fast, and how efficiently we will travel in the future. More importantly, it will likely determine how successful our nation economically competes in the ever-increasingly competitive world economy.

The importance of transportation is becoming more apparent, to even the casual observer, as a way to get and keep Northwest Indiana "on the move". From the Borman, to the Gary Regional Airport, to commuter rail service, to the port, Northwest Indiana is replete with opportunities to improve our nation's transportation system and with it, our ability to compete in the world marketplace. I would like to briefly describe a few of those for you now.

THE BORMAN EXPRESSWAY

The Borman Expressway -- Interstate 94/80 in Lake County Indiana -- connects, not only metropolitan Chicago with Northwest Indiana, but the eastern and western portions of the country. Named after astronaut Frank Borman from Gary, Indiana, the Expressway is the busiest road in Indiana, carrying 135,000 vehicles per day, nearly a third of which are trucks -- one of the highest known percentages of truck traffic in the nation. As you might expect, the Expressway is the most congested in Indiana, unfortunately often substantially slowing the heavy interstate traffic through our state. We have recognized the problems experienced by motorists in this area and have undertaken efforts to increase the capacity of this road, through both more pavement and better technology.

The state has four interchange modifications in development worth more than $100 million on the Borman Expressway which, as a result of being expedited by this administration, will all be completed by 1993. We have also begun the less traditional freeway management program which will increase capacity and reduce congestion by employing a sophisticated communication system using television monitoring equipment, computers, and radio and telephone information systems. The system will facilitate faster identification and response to accidents, thereby relieving the most prevalent cause of congestion on the Borman Expressway. We expect to have the early components of this multi-million dollar system in place in 1991. The State of

Indiana is committed to playing a major leadership role in both the development and implementation of new technologies to relieve traffic congestion.

Beyond these state initiatives, Indiana is also working with the federal government and its neighbor Illinois to seek national and regional solutions to the transportation challenges of Northwest Indiana, which are truly national and regional in scope. The Indiana and Illinois Departments of Transportation, with special funding made available by Congress, have undertaken a study to develop alternative solutions to relieve congestion on the Borman Expressway. As part of the study we will examine the feasibility of constructing a southern expressway in Lake County to improve the movement of transcontinental traffic. The study will also look at eliminating the tolls on the Chicago Skyway and a portion of the Indiana Toll Road to encourage motorists -- particularly truckers -- to use the currently underutilized Toll Road thereby relieving the congested Borman at relatively little cost. The Indiana Department of Transportation has taken the lead role in this study to find the best congestion relief solutions for Northwest Indiana and Northeast Illinois.

GARY REGIONAL AIRPORT

The State of Indiana is committed to both the independent development of the Gary Regional Airport and its designation as the third Chicago Area Airport. In terms of developing the airport, the state supported a $500,000 appropriation from the Build Indiana Fund to match federal Airport Improvement Fund monies. The funds will be used to make runway and taxi-way improvements which will enhance their structural strength and pavement conditions. These funds will also be used for land acquisition and obstruction removal.

As demonstrated by the current dispute and court battle over scheduling flights into Chicago, the take-offs and landings at the present Chicago airports are at the saturation point and may even be becoming dangerous. At certain peak hours, as pointed out in a recent national newspaper article, as many as 40 planes are scheduled to arrive at O'Hare in one five minute period. Meanwhile, located closer to the Chicago loop than O'Hare, sits the underutilized Gary Regional Airport. With its modern terminal and easy access to the Chicago Skyway and the South Shore Railroad, Gary Regional can provide direct, fast access to downtown Chicago and thereby serve right now as an excellent reliever airport for the region. As the nation's leading transportation policy-makers, I ask that your attention to this matter might include further discussion and future action to take advantage of our outstanding, yet underutilized, airport facility here in Northwest Indiana.

Beyond the immediate development of Gary Regional as an independent airport, Indiana strongly believes that the development of a third major Chicago Area Airport is essential to the vitality of Chicagoland, and the entire Midwest, as an economic hub for the nation and the world. We equally strongly believe that the best site for the airport is an expanded Gary

Regional Airport, which is in metropolitan Chicagoland. Because of the billions of federal dollars that will be included in the development of a third Chicago Area Airport, I believe that Congress -- likely this very Committee -- will ultimately have significant input into the location decision. I ask you to do all that you can to insure that this major decision is made based on the technical merits, not parochial politics, not only because it is the right thing to do, but because I believe doing so will result in the airport being located in Northwest Indiana.

AMTRAK AND OPERATION BOOTSTRAP

As I have already suggested, the best transportation infrastructure can only be developed through the combined forces of all public jurisdictions. Indiana has demonstrated continued support of local efforts to preserve needed public transportation. A case in point is unfolding right here in Northwest Indiana.

The state awarded the Northern Indiana Commuter Transportation District ("NICTD") $80,000 to study the feasibility of maintaining or realigning Amtrak's commuter rail passenger service from Valparaiso to Chicago, known as "the Calumet". This will give local officials the information to make decisions on whether tc appropriate funding for the continued operation of the rail line. If the results indicate such funding would be economically effective and justified, those funds may be made available through "Operation Bootstrap", another innovative project being proposed right here in Northwest Indiana.

Despite these efforts, Amtrak has unfortunately indicated that it will discontinue the Calumet at the end of this calendar year without giving local decision-makers an opportunity to consider the results of the study and seek state legislation to fund Operation Bootstrap. I have already been working with Congressman Visclosky, Congressman Jontz, Congresswoman Long, Congressman Lehman and others to convince Amtrak to reconsider its position. Today I strongly and publicly request all the members of this Committee to encourage Amtrak to extend the Calumet's service through June 30, 1991, so that Northwest Indiana may have the opportunity to save this service through the innovative Operation Bootstrap project. Doing so would be in the best tradition of intergovernmental cooperation, innovation, and plain common sense.

SOUTH SHORE

The South Shore is a vital railroad passenger service between Chicago and South Bend operated cleanly and efficiently by electricity. In order to improve the long-term stability of passenger rail services in Indiana, NICTD purchased the passenger assets of the Chicago South Shore and South Bend Railroad, with the help of our state administration, in December, 1989.

NICTD carries more than 6200 passengers a day. During the past several years, rush hour trains have experienced passenger loads 120% of seating capacity. In response to over-crowding, I have committed securing an additional $4.5 million in state assistance that will enable NICTD to purchase 14 new commuter rail cars and to help make major station improvements in Northwest Indiana. The administration is already providing much needed assistance to support NICTD's current capital improvement program. I have authorized the first-ever state transit discretionary grant of $800,000 and supported an $800,000 appropriation from the Build Indiana Fund, which I will discuss in more detail a little later.

With the state's help NICTD has stabilized the South Shore commuter service so that, for the first time in recent memory, it is no longer lurching from one financial crisis to another. Now that the administration of the South Shore's commuter service is in public hands, the potential for a long-needed local revenue source for the service - perhaps through Operation Bootstrap - is greater than it has ever been. While the state and local units of government do their share, the federal government must continue to do its fair share - as UMTA has been doing with the South Shore through locally matched grants - to support viable mass transportation, particularly as our highways are becoming more congested and our energy sources less reliable.

Let me add, Mr. Chairman, that along those lines the state of Indiana has taken aggressive steps to conserve gasoline and other petroleum products in the wake of the events in the Middle East. We have ordered all state agencies to promote car-pooling among state employees, for both the commute to and from work and for all in-state travel. We have also ordered department heads to postpone or eliminate as much out-of-state travel as possible, and to seek ways to significantly reduce the use of petroleum products at their disposal.

No program for improving our system of transportation would be complete without emphasis on the development of mass transit opportunities across our state and nation. Along with the South Shore railroad, the state has aggressively promoted mass transit in cities and towns large and small alike as a way of conserving both our roadways and our supply of energy.

PORT OF INDIANA

Burns International Harbor is the most modern port on the Great Lakes and is at the center of regional development. A recent study indicated that Burns Harbor is the most productive steel-exporting facility in the nation. It is a classic example of transportation planning at its best, bringing together a superb network of water, rail, and highway infrastructure.

The total amount of tonnage handled at Burns has increased approximately 25% during the last two years. Investments of more than $100 million have been made at Burns Harbor as a result of the Beta Steel Corporation decision to locate a new plant. Part of this corporation's decision was based on the strong and expanding industrial profile of Northwest Indiana and the superior design of this transportation hub. Burns Harbor is a prime example of how an efficient transportation system enhances economic development and competitiveness.

OTHER TRANSPORTATION PROJECTS

Of course, Northwest Indiana is not alone in the state when it comes to worthy transportation projects. Our administration is making progress on many important transportation projects around the state including, but certainly not limited to: the "Hoosier Heartland" corridor which seeks to connecting Fort Wayne and Lafayette via a major four-lane highway; the I-469 Fort Wayne bypass; the South Bend bypass; the Jeffersonville bridge; the Jasper/Huntingburg bypass; and the State Road 37 south corridor. This progress cannot continue without the full partnership of the federal government. For no project is this more true than the proposed Evansville to Indianapolis expressway.

As I noted in testimony (copy attached) submitted at the invitation of congressman McCloskey to this Committee's Surface Transportation Subcommittee hearing earlier this year in Washington, the third largest city in Indiana and its environs have been left without interstate access to the capital and its wide-ranging interstate access. The proposed highway between Evansville and Indianapolis demands a strong federal/state partnership. It is a much-needed and well-deserved transportation artery for the citizens of, not only Indiana but, the entire region and nation. Ultimately, we hope that the Evansville-to-Indianapolis highway could serve as a major link to effectively extend I-69 from Northern Michigan through the heartland to Memphis and the interstate access that city enjoys. This would truly be a highway of national significance.

INDIANA IS WORKING TO HELP ITSELF

While we strongly resist any abdication of the federal role in transportation, Indiana is not simply waiting for the federal government to solve our transportation problems. We believe the key to a sound transportation system is a strong partnership between federal and state government. To help be sure Indiana is positioned to keep up its share of the bargain, I proposed in my inaugural State of the State Address - over a year and a half ago - to put part of our new lottery proceeds in a "Build Indiana Fund" to be used for capital improvement projects, including highways and other transportation infrastructure. While I hope to have even more money earmarked for capital highway construction, I have been generally successful in protecting substantial amounts of Build Indiana Fund monies for new highway construction.

In keeping with our state's commitment to developing its transportation infrastructure, and in concert with the creation of the "Build Indiana Fund", I have announced a ten-year highway improvement program which, for the first time in our state's history, attempts to develop long-range intermodal transportation plans based on comprehensive data. A key element of the program is its emphasis on preserving and maintaining our tremendous investment in Indiana's roads and bridges. Preservation needs will more than double over the next ten years because of the need to rebuild our older interstate highways and to replace the large number of deficient bridges built during the public work programs of the 1930s. A respectable level of capital improvements has been identified for construction during the next decade. While we are continually striving to do more with less, such as the state-of-the-art freeway management system, we also recognize the need to build new roadways to reduce congestion and solve other transportation problems.

SUGGESTIONS FOR THE SURFACE TRANSPORTATION ACT'S REAUTHORIZATION LEGISLATION

As the Committee well knows, during the next several months Congress will be debating funding for a $90 billion multi-year federal highway and mass transit program, as the Surface Transportation and Uniform Relocation Assistance Act of 1987 expires on September 30, 1991. I appreciate very much the opportunity to provide input to this Committee from the State of Indiana on this critically important legislation.

Federal funding plays a vital role in the development of Indiana's transportation system. Without it, approximately one half of the work currently being done in all work categories, including bridge rehabilitation, interstate rehabilitation and major construction, could not be completed. For a number of years Indiana has sent more federal highway user fees to Washington than are returned to our state. Since 1956, Indiana has only received 75 cents for every dollar Hoosier taxpayers' have sent to Washington. We believe more equitable federal funding is necessary not only for Indiana, but all the states of the union.

In the 1982 Surface Transportation Assistance Act, Congress inserted a provision into the act which guaranteed each state would receive at least 85 percent of all federal transportation user fees sent to Washington. This "Minimum Allocation Provision" provided our state with an additional $74 million in transportation funds in 1989 alone. It is essential to Indiana, and to an equitable and sound national transportation policy, that the Minimum Allocation Provision be continued in the new federal legislation.

Unlike the recently enacted Minimum Allocation Provision, however, several federal funding formulas have been in place since 1916 and the factors used are simply out of date. We believe it is time to change the current federal funding formulas. Simply put, congestion and deterioration are functions of use, thus distribution of funds should be based on usage of the system as the greatest indicator of need. Current factors such as land area and postal mileage -- which a 1986 GAO report found not to be correlated to either the extent of the Federal Aid highway network or its use, are outdated and should be abandoned.

Indiana would like to see a more simplified transportation program in which the present complex system of 50 or 60 funding highway categories is reduced to two. The first category would be the Highway System of National Significance (HSNS). The HSNS would be composed of existing interstates and some principal state highways, including new routes such as the Evansville to

Indianapolis expressway or the Southern Expressway in Lake County. The intent is to create a state designated, federally approved, national system that is expected to focus a major portion of federal funding on a 150,000 to 180,000 mile highway system. In cooperation with the U.S. Department of Transportation, Indiana would designate its statewide portion of the Highway System of National Significance based upon criteria that reflects national objectives. We would like the factors in these formulas to include total statewide urban and rural vehicle miles of travel, total statewide urban and rural lane miles, and diesel fuel use. More specifically, we support an allocation system which would distribute one-third of the funds based on total statewide lane miles, one-third of the funds based on total statewide vehicle miles traveled, and one-third based on statewide diesel fuel consumption to reflect heavy truck travel.

We also strongly support increased flexibility for state and local projects, which should not only allow for some cost reduction in projects, but also decrease the amount of time necessary to complete projects. States know their own transportation problems and priorities better than anyone. They have the necessary technical expertise to remedy those problems at the state and local level, assuming a responsible degree of support from the federal level. Thus, this second part of the simplified program would be aimed at providing state and local governments with the flexible capacity to meet their distinctive transportation needs. Indiana would like to see this program designed to make funds available to the states for rural and urban highway needs on roads not listed on the Highway System of National Significance. We believe these funds should be distributed based on the amount of revenue a state sends to Washington. This flexible program would replace several existing categories and would cover all projects on the highways of national significance.

We support matching ratio for this flexible category of 75 percent federal and 25 percent state/local. This is identical to the matching requirements of existing programs. Any large increase in the state or local match would cause a tremendous burden on these units of government

I would also like to note that the transportation policy proposed by the USDOT to permit states to utilize toll financing, even if federal funds are also to be used on the same project, is an appreciated new-financing option for state and local governments.

Again, I would like to thank Congressman Visclosky and the other members of the Committee for this opportunity to present Indiana's perspective on transportation issues facing, not only Northwest Indiana, but our entire state and nation.

Testimony

To The

UNITED STATES HOUSE OF REPRESENTATIVES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Munster, Indiana
September 17, 1990

Submitted by:

Richard J. Cockrum
Executive Director
Association of Indiana Counties
101 W. Ohio, Suite 710
Indianapolis, Indiana 46204
(317) 684-3710

BACKGROUND

County government in Indiana is responsible for 66,000 miles of road or 72.5% of the total miles in the state. These road miles serve as a critical link between most Hoosiers and their ability to maintain a healthy economic existence. The 66,000 miles of county roads carry 27% of the state's vehicular traffic.

In addition, Indiana counties are responsible for 12,337 bridges of which 6,167 need to be rehabilitated or replaced. This figure includes bridges 20 feet or longer, it does not account for thousands of small bridges.

According to a study by The Road Information Program in 1989, traffic on Indiana's county roads has increased by 35% in the past three years and is expected to double by the year 2000. The same study shows that over 28,000 of the 46,000 miles of paved county roads (61%) are substandard and in need of major repair including resurfacing and reconstruction. Also, 97% of the over 19,000 miles of county-owned gravel roads need to be regraveled or paved.

HIGHWAY FUNDING

Our nation's transportation system surely qualifies as one of the most critical areas for intergovernmental cooperation. It is counterproductive to view our surface transportation network as seperate federal, state and local components. To better serve the needs of the people paying for the system, we must recognize it as one complex integrated system.

The roles of the three levels of government have been mixed and with the near completion of the interstate highway system we have the opportunity to address some problems of the past.

The federal role in highway funding is critical but consider the following: 79% of all rural and 74% of all urban roads in the United States are not eligible for federal aid. Federal highway funds coming to Indiana have decreased by over 17% from 1985 to 1990.

From 1956 to 1988 Indiana received 75 cents in federal highway aid for every dollar we sent to Washington. With the enactment of the 85% minimum allocation formula we have fared much better, but it's hardly a bargain to send someone a dollar and get back 85 cents.

Local units of government and the State have taken aggressive roles in addressing this crisis. The State, over the past decade, has raised motor fuel taxes several times and local governments have imposed numerous local option taxes. In fact, 75 of our 92 counties now impose a local income tax. Almost half of them have adopted the new tax within the past five years with highway funding being one of the driving forces behind the adoption. Still, with the increase in cost of materials and labor, and the decrease in federal assistance in all program areas (local governments have seen an almost 50% reduction, nationwide, in federal aid in the past decade) we have not been able to properly maintain our existing system, let alone build new roads.

INCREASED FLEXIBILITY:

One of the most frustrating experiences of a county commissioner in Indiana is to use federal funds for a transportation project. The "strings" and "red tape" attached to a federal dollar are enough to have many counties forego a federal aid project. It is highly unfortunate that a typical federal aid bridge project will take four years to complete. Sometimes as equally intimidating is the local match requirement. Many counties do not apply for federal highway assistance because they do not have the local funds to meet their share.

MASS TRANSIT

As disturbing as the low return on federal dollars for roads is, it is nothing compared to mass transit funds. For the period of 1984 to 1989 Indiana received 21 cents for mass transit for every dollar we sent. Hoosiers are known for our independence and self reliance, perhaps that is why we have one of the highest per capita vehicle usage rates. But it is inevitable with air quality problems, urban congestion and suburban mobility that we must rely more on mass transit in our state. To do so we should be receiving a larger share of federal mass transit funds. Also needing to be addressed is the lack of flexibility on mass transit funds.

RECOMMENDATIONS

In conclusion, the Association of Indiana Counties recommends the following:

1) The minimum distribution to "donor" states be increased. This can be done by either raising the 85% minimum allocation or adjusting the distribution formula.

2) A maximum amount of flexibility be granted to states and localities for use of federal highway funds. This can be accomplished through a block grant type program or reducing restrictions in the federal statute or regulations.

3) The Highway Trust Fund should be spent down to a reasonable balance and not be used as a ploy to show a reduced budget deficit.

4) Congress should avoid increasing motor fuel taxes to reduce the federal deficit.

5) There should be no change in the formula to favor states over local governments.

6) A minimum allocation should be established for mass transit funding. Mass transit funds should also have maximum flexibility.

7) Congress should oppose increasing state and local governments share on projects that require matching funds.

NICTD

TESTIMONY OF GERALD HANAS, GENERAL MANAGER
NORTHERN INDIANA COMMUTER TRANSPORTATION DISTRICT
Before
THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

SEPTEMBER 17, 1990

Transportation is as necessary an element of the national, regional, and local economy as are jobs. A well balanced transportation system is a requirement for economic health, vitality, and growth. The U.S. Department of Labor estimates that in 1987, nearly 19% of consumer spending was spent on Transportation, second only to housing in dollars spent. This large percent of a consumer's budget is spent on a service that, with few exceptions, has no intrinsic demand - it is not demanded for what it is. Transportation is unique in the range of economic processes for it is demanded not due to any unique attributes of the mode or system, nor is it demanded and consumed in and of itself, but because economic activities and factors of production and consumption are separated by distances and need to be assembled in one place for economic transactions to occur. Without transportation these economic transactions cannot take place and societal wealth cannot be created.

Since the process of transportation is not in and of itself that which is demanded, but rather is an intermediary process which contributes to economic well being, it is especially important that a balanced transportation system be available so that as little cost as possible be consumed in the process of travel, thereby freeing up resources and capital for the primary purpose of this society - creation of wealth. A balanced system contributes to a reduction in transaction costs by promoting competition, but more importantly, by making available that transport mode with the characteristics most appropriate for the type of travel required.

I manage a metropolitan commuter rail system in the Chicago/Northwestern Indiana region, The South Shore Line Rail Passenger Service. When I first became involved with this system, only about 3,000 people rode the train on a daily basis. In the twelve years since my involvement, ridership has over doubled - now over 6,200 people take the train, contributing to a daily average ridership of about 12,500 trips. Over $100 million in local, state, and federal money has been spent over the past twelve years to get the system where it is today and to over double the ridership, and more will be needed. How does this relate to a balanced transportation system? Those 6,200 people ride the train over a very limited period of time, about a 2 1/2 hour period in the morning and again in the evening over a 2 1/2 hour time period. To put this many people into automobiles to make the same trip in the same time interval would require two additional highway lanes going into the City of Chicago and an extra two lanes leaving Chicago. The average length of trip for our rider is just short of 30 miles. Does anyone believe that a four lane urban interstate 30 miles long could have been built and maintained during this time period for $100 million? Without our rail service, without a balanced transportation system, the question of cost for a 30 mile long urban interstate would not be speculative - the question would have to be asked, and further, the road would have to be built, regardless of the cost, because the need is there.

Appropriate public investment in a balanced transportation system saves society untold millions of dollars which can be better spent in other wealth creating activities.

In low density urban and rural areas an appropriate transportation investment strategy may emphasize a dense network of streets and highways. In large metropolitan regions, such as Chicago, an appropriate investment strategy must include a high capacity network capable of handling large numbers of people in a short period of time and be consistently safe, economical, and quick.

A balanced transportation system must provide a range of modes - choices - so that the best option for a range of needs will be available for use when needed. To provide for a balanced transportation system, a balanced investment strategy must be developed and implemented. An unbalanced investment strategy will lead to an unbalanced transportation system and a wasteful, inefficient investment.

When choosing from a range of transportation projects in which to invest, direct monetary costs must, of course, be considered. But the indirect costs, or externalities, must also be considered to create not only a balanced transportation system, but also to contribute to a balanced economic system of which transportation is only one component, albeit an important one.

The region through which The South Shore Line operates is not in compliance with the Environmental Protection Agency's Clean Air guidelines. Further development of heavy industry is severely curtailed, so the region, closely linked with the steel industry, must restrict expansion in the economic sector of which it is preeminent. This region has just undergone a major structural change in its economy with significant disruptions to its job force. Continued, unrestricted growth in the use of the automobile, which is a significant air polluter, directly reduces the number of jobs which can be created in Lake and Porter County, Indiana. While I have no quarrel with clean air, I must take issue with the concept that because automobiles are allowed to continue to pollute the air, fewer steel jobs can be created or existing jobs retained. A transportation policy and investment strategy that continues to promote highway expansion, that impairs the ability of mass transit to do what it does best - move people - seriously impairs the economy and economic growth, at the local, regional, and national level, and undermines the true role of transportation as a lubricant for economic transactions. Fewer automobiles polluting the air in Lake and Porter County will lead to cleaner air and the lifting of economic development restrictions. More jobs can then be created. The South Shore Line helps reduce the number of automobiles in use, thus it will directly contribute to the creation of regional jobs.

In closing, a balanced transportation system calls for a balanced investment strategy which in turn leads to a balanced, strengthened economy. Any public investment for transportation must include significant levels of funds for public mass transit. Public investment strategies over the past forty years have not been balanced. That led to a systematic decline in the contribution and role of mass transit as a component in a balanced transportation system. The decline in fortunes of mass transit was reversed with a pattern of federal investment in the operating and capital needs of transit systems throughout the country. Do not undo the good that has been done to date, for much remains to be done.

Thank you for inviting my testimony today. I will be happy to answer any questions you might have.

UNSAFE RAIL-HIGHWAY CROSSINGS IN INDIANA AND RAILROAD ABUSES

Presented
on
9-17-90

BY:

Rudolph F. Kapitan

President CARRS, Inc.
6929 Hendricks St.
Merrillville, Indiana
46410

Good afternoon ladies and gentlemen,

From the moment we are born, society takes great care and exerts much effort to protect and to preserve human life. In our country that effort is well manifested not only by our medical community but also by industry and science where virtually all their efforts are spent to promote and protect life. Man's primary instinct is to preserves himself. We call that the instinct of self preservation. The manifest actions of society attest to that most worthy and noble instinct. There is, however, a force, a system in our Society which counters those basic aspirations geared to promote and protect life. That system is the railroad industry in the United States. For too long they have been allowed to wallow in callous disregard of our rights as they take from us our lives, our limbs and our properties. Each year thousands of families are ravished by nightmares caused by an irresponsible railroad system.

In my hand I have a death certificate. It is a death certificate of my 30 year old son Rudy J. Kapitan. It specifies that his death occurred at the Grand Trunk's Hendricks St. crossing in Merrillville. Here is a photograph of his crushed vehicle. If you will look closely you will see his mangled body laying some 25 feet from the wreckage. Rudy was returning from Church early Sunday morning Nov. 6, 1988. It was a snowy day and the visibility was poor. No gates or lights were there to warn him of an extremely hazardous situation. It was at this crossing in Oct. of 1987 that Julie Rothenberg was killed and that Frank Razmus was killed in 1986. Three fatalities in less than 30 months to say nothing of many other accidents at that infamous crossing. Dana Meulemans of Griffith is a survivor of one of those tragedies. His life was forever unmistakeably altered there on July 22, 1981 by a speeding Grand Trunk freight train. To this day the nightmare of this 26 year old Dana haunts him as he continues to make attempts to recover from that crushing, near death experience.

I quote State Statute; " The railroads are responsible to afford security for life and property of persons and vehicles using the public highways. Does the photograph of Rudy's mangled body and crushed vehicle connote compliance with that statute. Do three fatalties in less than 30 months at the Hendricks St, crossing connote compliance? There could't be a more flag rant violation of that statute! It typifies railroads callous disregard for what most of us holdsacred - LIFE! Federal Railroad Administration statistics paintan alarming picture of carnage at rail-highway crossings throughout Indiana. According to these statistics published by the FRA in their RAIL-HIGHWAY CROSSING ACCIDENT/INCIDENT and INVENTORY BULLETIN NO. 10, published in August of 1988, of all the states in the union, Indiana, although it ranks 15th in population and 34th in land area, ranks FIRST in total fatalities caused by passenger trains at rail-highway crossings; SECOND in total casualties and THIRD in total of all fatalities at rail-highway crossings.

These horrendous statistics prevail not because of our large land area. The land area of Ind. is 36,000 square miles, or 1% of the 3,600,000 square miles of land area for the entire United States. Yet, 8% of all rail highway fatalities occur in our state - ONE OF EVERY TWELVE RAIL-HIGHWAY FATALITIES IN ALL OF THE UNITED STATES HAPPEN IN INDIANA. When we encourage travelers to "Wander Indiana" we should warn them that their chances of getting killed or injured at rail-highway crossings in Indiana are better in our state than in any other state in the union!!.

The statistics mentioned above are not the result of a high volume of vehicle registrations in Indiana. With 4.5 million registrations, Ind. ranks 14th of all the states in vehicle registration. Yet, per 10,000 registrations, Ind. ranks

2nd in total train car accidents; 2nd in total injuries and 3rd in total fatalities at rail highway crossings.

Are we Hoosiers a wreckless lot hell bent on self destruction? Is that what the FRA, the railroads and Operation Lifesaver want us to believe? Do they believe that Hoosiers' rights are adequately protected at railroad crossings in Ind.? To place the blame for these shocking statistics on us, the Indiana motorist, is an affront to our intelligence!!

I submit that when you or I fail to be 100% attentive to the demands placed on us as highway users, we're only human! Should we then be condemned to death because of our humanity, because of a momentary misdirection of attention? Should not the extreme hazard of a MEGA TON TRAIN, speeding along at up to a permitted 110 m.p.h. be unmistakably marked as EXTREMELY HAZARDOUS?? Killers on death row are afforded more consideration than this.

The state of Ind. has the most uncontrolled crossings in the United States. Of the 7744 rail-highway crossings in Ind. only 967 are protected by gates and lights - 88% of all our crossings do not have gates and lights!!

In Aug. of 1989, I wrote to Vice Pres. Quayle. I quote from that letter - "From one Hoosier to another, Mr. Vice President, I am appalled by the horrendous statistics regarding railroad crossing accidents and fatalities. I'm ashamed to know that our State has faired so very poorly in protecting Hoosiers' rights to life. I'm devastated by the fact that we in Ind. have proved so powerless against the mighty railroads. Mr. Quayle, Vice President of the United States, fellow Hoosier, we look to you for assistance and guidance as we proceed in our cause to make railroad crossings safer not only in Ind. but throughout the United States. We ask, Sir, for your recommendations and support as we begin our 'David & Goliath' struggle with the powerful railroads." End of quote. I was disappointed that there was no response from Vice Pres. Quayle or from his office.

A similar letter went to Governor Bayh. His response began, and I quote, "As Governor I receive many letters. Yours especially touched me because it eloquently conveys your love for Rudy; a love so strong that a positive force emerged from grief. Your commitment to prevent further tragedies is an enduring tribute to your son Rudy." The Governor continues: "It is imperative for local officials to take the initiative in securing available federal and state money... It is equally important for Hoosiers to contact their congressmen and senators about the need to continue Section 130 Rail-Highway Grade Crossing Safety Program. Section 130 is vital because without it, there would not be any enforcement of railroad safety. This program expires on Sept. 30, 1991. I assure you that my Administration will lobby Indiana delegation and support your group's efforts to continue this program." End of quote.

Ladies and Gentlemen of this committee, we need your support at the Federal level to fund and implement safety programs in Indiana, mindful, however, that the railroads must be made to pay their fair share.

Three weeks after Rudy's death, gates and lights were installed at the Grand Trunk's Hendricks St. crossing, paid for with State and Federal funds. The improvement cost the railroad not a solitary dollar. As a matter of fact they most likely made a profit on the installation since their crew did the work with material supplied from the railroads warehouses. The Grand Trunk and the FRA knew of the extreme danger at that crossing. The Hendricks St. Hazard Index assigned to it was formulated based on a questionnaire prepared by the Grand Trunk. Prior tragedies were used in the compilation of the Hazard Index for Hendricks St. The railroad knew that if they waited long enough, perhaps for another fatality, the order to place the improvements would be issued by the State who would then be responsible for the payment. And, so it was. My son Rudy was killed, Senators Lugar and Quayle issued a directive to Jack Isenbarger, Director Indiana Dept. of Highways and the gates and lights were on their way. The Grand Trunk became the beneficiary of this improvement at our expense, at the expense of my son's life!!

The maintenance of those gates and lights,installed by a Grand Trunk crew, became their responsibility. Guess what? The Grand Trunk struck out again. Those gates and lights have malfunctioned many times since their installation. Example: on July 9, 1989, lowered gates and flashing lights signaled, for hours, the approach of trains which never came. On the July 22nd & 23rd weekend, the gates were down and lights flashed continuously for over 16 hours. On Nov. 3rd 1989 at 6:30 AM, my wife Mary and I crossed around lowered gates. The Merrillville police Dept. was notified. Again, at 10:00 that morning, with much apprehension we crossed around lowered gates as the malfunction continued uninteruptedly. I was at the crossing at 2:00 PM when Grand Trunk truck #424 arrived. I asked the driver his name and the time he was dispatched. Tom Brozo said he received a call to go to the Hendricks St. crossing at 1:30 PM, approximately 7 hours after the first report went in to the Grand Trunk by the Merrillville Police Department.

On Dec. 30, 1989, an extremely foggy day, those newly installed gates and lights, installed under the supervision of and by Grand Trunk personell, signaled the approach of oncoming trains uninteruptedly for over 10 hours. Hundreds of vehicles crossed around those lowered gates. My wife and I did four times (we live about a mile south of the crossing). We called the Merrillville Police Dept several times. We were assured that the Grand Trunk was notified. Since the RR failed to respond I asked the Police for the telephone number. They said it could not be given. It was after 11:00 PM that night when we crossed those tracks under extremely foggy conditions. The gates were down and lights flashing since midday. I again called the police dept and suggested that they close our road because of the extremely hazardous condition which existed at the crossing. I convinced the Sgt. on duty to give me the Grand Trunk's Tel #. I then called Pontiac, Michigan and spoke with a Terry Biggerstaff. He said he knew nothing about the malfunction. Sarcastically he added that he certainly could do nothing about it as long as he was talking to me. His attitude reminded me of Merrillville Town Board Member Bill Kurtis'assessment of the Grand Trunk and it's personnell He said I may quote him, and, so I do: "The Grand Trunk and their personnell are arogant, uncooperative bastards". Bill had many years of frustrations at the hands of the Grand Trunk. All these instances of the Grand Trunks callous disregard for our rights happened at just one crossing in Merrillville. Our police department was powerless to do anything as the Grand Trunk flaunted a superiority protected by the Federal Authorities. There are two other Grand Trunk crossings in Merrillville which are in deplorable condition. Our town Fathers and our Police Dept. have again been powerless in their attempt to correct railroad violations. It is not uncommon to see parts of automobiles strewn over the Taft St. and Broadway crossings - mufflers, broken shocks, tailpipes and entire exhaust systems. Numerous accidents happen at these crossings. The posted speed limit on these State Highways is 35 m.p.h. In order to negotiate the crossings with an intact auto, you must come to a near complete stop. In June of 1989 the Grand Trunk made repairs to the Taft St. crossing which was closed for days. When it reopened it proved to be a tribute to shoddy and ineffective railroad repair work.

Not long after my son Rudy's tragic death, we organized a group of concerned citizens and victims of railroad attrocities. We named the organization CARRS.

Citizens Against Railroad Slaughter. Our primary objective would be to promote safety at rail highway crossings. To that end we outlined six proposals as goals for our organization. 1) Demand flashing lights as minimum protection at every rail-highway crossing in Indiana. 2) Require mandatory alcohol and substance abuse testing of all railroad personnellinvolved in any accident. 3) Set a time limit for a railroad to correct malfunctioning signals, imposing penalties for delays. 4) Educate through media publicity in order to correct railroad abuses. 5) Promote legislation which would compel the railroads to pay their fair share for rail crossing improvements. 6) In general, whenever or wherever necessary we will strive to promote safety at every rail-highway crossing in Indiana.

With regards to our first proposal - flashing lights at every crossing - we ask that you allocate funds for that purpose, or promote legislation which would compel the railroads to do so. The railroads must be legislated into being responsible for their fair share of the cost of improvements to their right of ways. The scales of justice must begin to be tipped towards center position. The excessive burden placed on our federal and state tax revenue dollars by the railroad, have for too long been shouldered by a society continually plagued by legislation geared to protect a callous railroad system, even to the detriment of and at the expense of human life.

Our second proposal is one that would mandate alcohol and substance abuse testing of all railroad persomell involved in any accident. Again, legislation is geared to protect the railroad and its persomell. They claim it would be a violation of their fourth ammendment rights. What about the rights of the slaughtered victim. My son's body was carried to a morgue to be further violated by a mandatory autopsy. The train engineers, the killers if you will, were allowed to leave the scene without as much as a breathalizer. What an obscene travisty of justice. This cannot be allowed to continue.

Had our third proposal, setting a time limit for railroads to respond to correct malfunctioning signals and impose penalties for delays been implemented, there would have been a prompt response by the Grand Trunk to correct all those incidents of malfunctioning at the Hendricks St. crossing, as outlined above. I have asked our town board president to implement this third proposal. My request has fallen on deaf ears. Perhaps one of you has a recommendation.

Our fourth proposal is one of educating the public through media publicity. Some of my testimony today is about that. CARRS proposes that we have a right to be informed regarding railroad hazards without federal restriction and prohibition. Federal legislation which protects railroad abuses from disclosure must be changed. Prohibition against disclosure of state reports and surveys as outlined in Chapter 4 of Title 23, U.S. Code prohibits the release of, and I quote "reports, surveys, schedules, lists or data compiled for the purpose of identifying, evaluating, or planning the safety enhancement of potential accident site, hazardous roadway conditions, or rail highway crossings." In my hand I have a copy of such a contraband survey. Bob Savage of Fort Wayne was killed at the unprotected Dogwood Road crossing in Marshall County. His widow Carol paid a private investigator several hundred dollars to obtain this survey. It specifies that of all the rail-highway crossings in Marshall County, the Dogwood Crossing, Bob Savage's death crossing, had the highest hazard index. Yet to this day, the crossing remains mechanically unprotected because reports such as this hazard index report has a disclosure protection by Federal law. My letters to the FRA and others for information regarding the hazards at the Hendricks St. crossing where Rudy and Julie and Frank were killed, have all gone unanswered. That type of protection afforded the railroads by a federal agency must be stopped and the laws changed.

The fifth proposal asks that the railroads pay their fair share for improvements made to and on their right of ways. In Indiana the disproportionate sharing of these improvement costs is alarming. The Indiana Public Utilities Commission determinesthe division of costs between the railroads and highway authority. Generally it'sfunded 90% Federal revenues and 10% State revenues. In Michigan according to a letter received from Earl C. Opperthauser, V.P. and General Counsel of the Grand Trunk Western Railroad Co., quote " The State (Mich.) contributes 65%, the local road authority 10% and the railroad 25% for installations...When the Michigan Department of Transportation orders in automatic protection and neither Federal or State funds are available, the statute requires a 50-50 split as between the railroad and the road authority" end of quote. Indiana lags far behind our neighboring state of Michigan, and FRA statistics attest to that also.

The November 1989 issue of Railway Age published past and proposed grade crossing outlays. The 1985 to 1987 average expenditures at public rail highway crossings, apart from maintenance expenditures, total $520,000,000. 57% of all the funding was supplied by Federal Funds, 33% by State funds and only 10% by the railroads. 100% of the maintenance costs should have been provided by the railroads; but, that was not the case. State and Local authorities contributed over $16,000,000. to maintain railroad right of way equipment and improvements. I repeat, ladies and gentlemen, you and I pay a disproportionate share of total expenditures at rail-highway crossings. Estimated annual needs for public rail-highway crossings through the year 2005 total $853,000,000. According to 1985-87 averages, the railroads share in improving and maintaining their right of ways would be a paltry 8 million of the projected 853 million dollars needed. That must be changed!

Most of the rail-highway crossing safety related work is funded by Section 130 (203). It is the fate of this program, whose current authorization expires in 1991, that has railroad people worried says Railway Age. They are concerned not only about its renewal, but in what form it might be renewed. There is fear, for example, that the current 90% federal - 10% local match formula might be revised to require a higher local share (which could mean higher costs for railroads); or that states might be given some discretionary authority over the expenditure of this "dedicated" money - in which case, railroads believe, much of it would be dedicated to other than crossing safety needs. That is exactley what we need. The railroads must begin to pay their long overdue fair share! The architects of a new National Transportation Policy must include voices such as mine so that long overdue railroad improprieties be corrected.

There is much public outcry regarding the Savings and Loan scandal and the bailout at taxpapers expense. We have had a railroad bailout scandal for years and years. That scandal has not been addressed. It is time to do so here and now.

The voice of my son Rudy cries out from his grave to correct the obscene and disgraceful state of railroad affairs in Ind. From hundreds of graves throughout Ind. Rudy's lament is joined by the cries of hundreds to put an end to railroad abuses, to the kind of irresponsibility which denied them their constitutionally guaranteed right to life, liberty and the pursuit of happiness.

The nightmare caused by Rudy's tragic and violent death will never cease. It is with broken hearts that we consider the acts of omission and commission of those responsible for rail-highway safety. Legislative bodies continue to be plagued by legislation geared to protect what the railroads claim to be their unjust and unfair rights, at our expense. Powerful lobby groups are positioned throughout this state and nation, concerned only with promoting the selfish demands of railroads.

CARRS, Citizens Against Railroad Slaughter invite your individual and collective assistance. Special thanks to Congressman Visclosky and to his Legislative Director, Robert Falb for incorporating rail-highway safety as a topic for discussion at this hearing; and thanks for asking me to participate.

Statement of Terry J. Kleban

TO: MEMBERS OF THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

I am testifying before this Committee in hopes that something can be done to alleviate the congestion on the Borman, surrounding expressways and toll roads in Northwest Indiana.

As a professional driver, I travel all of the connecting expressways and toll roads on a frequent basis and I'm amazed at the number of people utilizing the Borman.

Driving to or from Chicago, drivers have three alternatives. They can either travel the Chicago Skyway (I-90), take the Dan Ryan (I-94) and link up with the Calumet, Kingery and Borman at the state line, or take the Tri-State (294) and make a circuitous route to their destination.

If the Indiana Toll Road and the Chicago Skyway is utilized, drivers encounter rough pavement with a perpetual closed lane in either direction combined with an excessively high toll.

Commercial vehicles, going to and from the heavy industrial centers in Northwest Indiana served by the Toll Road and Skyway, feel the brunt of a regressive and cost prohibitive toll to utilize the only viable means of access to the Chicago markets.

If people choose to go thru the city on the Borman, Kingery and Calumet Expressways, then delays are encountered because over saturation during peak commuter times and ongoing construction and maintenance.

If the Tri-State is utilized, then one can expect toll collection barriers every twelve to fifteen miles causing massive delays. As you can readily see, this is not the most energy efficient and economical way to do business.

It has been said that the fifteen miles between the state line and the toll road entrance are one of the most densely travelled sections of roadway in the United States; three lanes in each direction dumping into I-65, I-90, I-80, I-94 and I-294.

Anytime there is an accident or lane restriction of any type, the system breaks down because one highway feeds from another. Many times I have been forced to sit in slowed or stopped traffic for forty-five minutes or an hour because of an accident or road construction. Since a large majority of commercial drivers are paid by the mile or percentage, they are not compensated for the additional time on their trip while sitting in slowed or stopped traffic. The automobile commuters also are late for work or late getting home to their families. This means lost productivity and delays.

My recommendations to this COMMITTEE [illegible] panel would include but not be limited to the following:

(A) Consideration of lowering the Skyway Toll charge. This would ease some of the traffic off the Borman, possibly by 10% to 15% onto the Toll Road and Skyway.

(B) Adding another two lanes in both directions from the state line to the Indiana Toll Road, a distance to fifteen miles.

(C) Extend Cline Avenue expressway south and link up with a newly constructed U.S. Rt. 30 Bypass from Merrillville to Valparaiso.

(D) I would THEN build a limited access highway ~~to bypass~~ THE MILLS because new business construction has a way of developing along bypasses, bringing with it stop lights, shopping centers, etc. thereby defeating the purpose of a bypass. AND CREATING GRIDLOCK

(E) Entice commuters to park their cars at conveniently located, safe, well lit parking lots and take commuter buses to and from the mills and Chicago. These commuter buses could coordinate with the South Shore and Amtrak to offer fares that would be attractive to commuters. These modes of transportation would have to be dependable, safe, affordable and on time.

If some of these recommendations are acted upon, I think some of the traffic flow problems we have in Northwest Indiana can be resolved.

I thank you for your time.

Sincerely yours,

Terry J. Kleban

WRITTEN TESTIMONY OF

COLIN MACKENZIE
CHAIRMAN
TRANSIT FINANCE COMMITTEE
NORTHWESTERN INDIANA REGIONAL PLANNING COMMISSION
324 OGDEN DUNES
PORTAGE, INDIANA 46368

BEFORE THE
INFRASTRUCTURE FIELD HEARING
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

MUNSTER TOWN HALL
MUNSTER, INDIANA 46321

SEPTEMBER 17, 1990

Mr. Chairman and Members of the Committee:

I wish to thank you for coming to Northwest Indiana to listen to transportation needs and concerns in Northwest Indiana. I appreciate the opportunity to speak on behalf of the needs and concerns of mass transit in Northwest Indiana as you prepare to reauthorize the Surface Transportation Act.

Transportation is the movement of people, goods and services. Our nation has prospered and developed in large part due to the development of highly efficient transportation and commmunications networks. Transportation discussions often emphasize the movement of vehicles. My remarks on mass transit, however, will emphasize the movement of people. Mass transit offers an alternative to private autos by moving people in high occupancy vehicles such as trains, buses and vans while simultaneously reducing congestion, improving highway safety, conserving gasoline, reducing noise pollution and improving the quality of our air.

Transit 2000, a pamphlet published by the American Public Transit Association (APTA), is an excellent summary of mass transit's benefits, needs, concerns and recommendations. A copy is attached to this statement for your review. My remarks will focus on mass transit in northwest Indiana.

PUBLIC TRANSIT IN NORTHWEST INDIANA

Description of Services

Northwestern Indiana public mass transit systems serve over seven million passengers per year on a commuter rail system, a commuter bus system, five local bus systems and over fifteen paratransit systems in three counties representing both urban and rural populations.

The South Shore Railroad is a public corporation and provides interurban commuter rail service to both Indiana and Illinois residents, most of whom work in Chicago. Its ridership has increased steadily in past years and in 1989 it served over 2.6 million Indiana passengers and over one-half million Illinois passengers. The electric powered train maintains air quality and provides service to both urban and rural areas in four counties from South Bend to Chicago.

Amtrak provides a commuter rail service between Porter and Lake Counties and Chicago. It serves over 100,000 passengers per year.

A privately owned commuter bus system transports over 300,000 Indiana passengers between Lake and Porter Counties where they live and Chicago where they work.

Local public bus systems in the five cities of Gary, Hammond, East Chicago, Michigan City and LaPorte serve over three and one-half million passengers per year. Many of the passengers are students, the elderly, and those who can't afford cars or are otherwise unable to drive.

About 15 social service organizations provide public transit on a demand response basis to the elderly and handicapped. In 1989 they provided service to over one-half million passengers.

Benefits to Northwest Indiana

Approximately 41 rail cars, 21 commuter coach buses, 76 city buses and 200 paratransit buses and vans contribute to the transportation infrastructure of Northwest Indiana.

All sectors of northwestern Indiana society use the service including the employed and unemployed, the youth and the elderly, the affluent and the poor, the handicapped and the able-bodied.

Both public and private corporations and organizations provide the services.

According to APTA estimates, the over 7 million northwestern Indiana mass transit passengers who annually choose not to drive private autos also helped to conserve energy and they improved the quality of our environment.

They reduce congestion on our already severely congested highways and roads. Over two and one-half million private autos per year are removed from northwest Indiana roads and highways each year.

They save over 92 million gallons of gasoline per year, or the equivalent of 231 large storage tanks.

Over 290,000 tons of air pollutants are removed from our air each year. Those pollutants include hydrocarbons, carbon monoxide, nitrogen oxides and particulates. They would fill 3,843 large rail container cars to capacity and the train would be nearly 5 miles long!

NEEDS AND CONCERNS

We need to build a sound financial base for our public transit systems. Federal funds for mass transit have been reduced by an average of 8 percent per year for the past five years and those funds have not been replaced by any other source.

Declining federal funds have caused a corresponding decline in the quality of service provided to our passengers. Repairs and maintenance of vehicles have been delayed so that minimum services can be maintained. Capital investments needed to modernize and expand fleets so that services can be improved are put on hold year after year.

Our mass transit fleets are aging and vehicles breakdown frequently. Passengers often find their rides uncomfortable and they are sometimes unable to get to their destinations on time. We have been unable to afford the cost of expanding transit services to city residents who need transportation to jobs and services in the suburbs or to rural residents who also have special transportation needs.

The Administration has proposed that federal operating funds be eliminated for mass transit systems in urban areas with a population over 1 million people. Its rationale is that federal operating funds account for less that 6% of the operating budgets of large urban systems. Northwest Indiana has been federally designated to be part of the larger Chicago metropolitan area but its systems are small relative to the Chicago rail and bus systems. Federal funds accounted for over 30% of our mass transit operating budgets in 1989. Elimination of federal operating funds would have a devastating effect on mass transit in northwest Indiana!

Without a reliable and predictable source of funding for mass transit, northwest Indiana cannot successfully plan or implement federally mandated, but unfunded, improvements to our mass transit system or to meet the changing transportation needs of our people.

Over the past decade there have been population shifts, a changing economic environment and a decline in national commuter rail systems. Many former Illinois residents have moved to the West Lake County area and many of them continue to commute to their jobs in Chicago. A significant number of people who commute to jobs in Chicago also live along the corridor from Valparaiso to Chicago and the present Amtrak commuter rail service is likely to be terminated within months. Our residents also do not have access to any mass transit that would transport them from one area of northwest Indiana to another.

Northwest Indiana has studied and identified a need to establish a new commuter rail service along mostly existing track from Lowell to Chicago along the Westlake Corridor, a need to replace the terminating Amtrak commuter rail service from Valparaiso to Chicago, and to expand its local city bus service to include regional inter-city bus services.

The costs for these new systems would require federal, state and local funding. It is critical that we begin immediate acquisition of rail corridors and some of the track will need to be replaced or improved. New and used rolling stock needs to be purchased. More planning is required to balance and integrate our mass transit and highway systems. However, the benefits would be to provide alternatives to private auto use for all our citizens, improve our transportation infrastructure, reduce congestion on the highways, conserve energy, and improve the quality of our air.

The costs for these new mass transit systems would also cost less than building new highways. APTA estimates show that major highways can cost $100-120 million per mile. However, busways can be built for $10-20 million per mile and commuter rail systems along existing track cost considerably less than major highways.

In recent years federal legislation has been enacted which mandates costly changes and improvements to our mass transit systems but it has not provided the funding with which we can make them.

The Clean Air Act mandates that all new buses purchased must contain alternative fuel engines. Those engines would reduce the emmission of air pollutants but they significantly increase the cost of buses as well. Our mass transit systems cannot afford further capital costs as federal funds are declining and operating costs are rising. Without increased funding to comply with the alternative fuel engines mandate, northwest Indiana passengers may face an even further decline in the quality service.

The American Disabilities Act mandates that disabled citizens have equal access to mass transit, a goal in northwest Indiana for many years. The Act requires that all newly purchased mass transit vehicles must be equipped with wheelchair lifts, another significant cost increase for new vehicles. Our transit systems must also increase planning costs so they can develop plans for complying with the Act within within the required 18 months. However, no federal money is available to assist our transit systems comply with the mandates. Again in the attempt to improve transit services for all our people, we are caught in another cost squeeze and the effect may actually be a further decline in quality of service.

LOCAL AND STATE EFFORTS

At the local level, our mass transit systems have cut their operating and capital expenditures. To maintain minimum services, our systems annually trade away a portion of their federal capital dollars to northeast Illinois in return for their operating dollars. The trade causes northwest Indiana to lose $1 for every $3 traded. The result is delayed capital investments.

Several transit systems have also raised their fares in recent years.

Operation Bootstrap is a joint effort by both the public and private sectors in northwest Indiana to raise local revenue which would partly fund regional and local transit projects. A legislative proposal is being packaged to be presented to the next session of the Indiana General Assembly. If it is successful, northwest Indiana could be empowered to raise regional revenue to help pay for regional and local transit projects.

At the state level, the funding source for mass transit is .76% of the 5% state sales tax and it has not been increased in past years. An Indiana Transportation Association proposal to raise the mass transit fund from .76% to 1.20% will be presented to the next session of the Indiana General Assembly. We are hoping for favorable consideration of and legislative action on the proposal which would add about $2.8 million to 8 transit systems in northwest Indiana.

SPECIFIC RECOMMENDATIONS

We believe that public mass transit in northwest Indiana is benefiting our own citizens as well as helping to meet our national goals of a balanced and integrated transportation system, an improved transportation infrastructure, reduced highway congestion, increased highway safety, improved air quality, equal access to transportation for all citizens, and energy conservation. We also believe that support and funding for mass transit should be a partnership of all levels of government.

The federal level of support for mass transit has been declining in past years and we strongly urge that it be restored and treated as a higher priority as it is in most other developed countries.

As you prepare to consider the Reauthorization of the Surface Transportation Act we urge the following:

- The funding level for mass transit should be adequate to meet our national goals. APTA estimates that $11 billion level is necessary to adequately fund mass transit. There should be a spend-down of the Mass Transit Account of the Highway Trust fund.
- The funding sources for mass transit should be reliable and predictable so our systems can plan for longer than one year at a time. The annual gas tax receipts for all mass transportation programs should be increased.
- Federal operating assistance needs to be maintained for the smaller mass transit systems which are considered to be part of large metropolitan urban areas.
- The federal share for all programs should remain at current levels. The Administration's proposal for a 60% federal share would make it more difficult for northwest Indiana mass transit systems to compete with the larger urban systems for federal funds. Large urban areas can raise more local matching dollars.
- Mass transit and intermodal transportation planning funds need to be increased to assure balanced and integrated transportation programs for northwest Indiana.
- Local flexibility needs to be maintained so that we in northwest Indiana can determine our own mass transit and intermodal transportation prioities.

Thank you again, Mr. Chairman and Members of the Committee, for listening to the needs and concerns of mass transit in Northwest Indiana.

1991

TRANSIT 2000

Executive Summary

of the American Public Transit Association's Transit 2000 Task Force Final Report

No threat to the quality of life in our communities is greater than the continuing decline of mobility. Explosive growth in travel demand, inattention to transportation investment needs, the harmful consequences of land use decisions, and our insatiable appetite for automobile use are overwhelming our transportation systems and facilities. In turn, the increasing inability of those transportation systems to handle the efficient movement of people and goods undermines our regional economies, weakens our international economic competitiveness, and dramatically diminishes the quality of our environment.

In the face of these challenges, we are afforded a rare opportunity to fashion a new generation of national transportation policies, as current federal programs expire and new national leadership embarks on an effort to formulate new policies to guide future transportation investment in America.

In response to these challenges and opportunities, the APTA Transit 2000 Task Force was formed in 1987 to explore how we can create more productive and liveable communities, and to outline the major contribution that public transportation can make in that effort. The Task Force believes that the fundamental principles and program recommendations that are highlighted here reflect the kind of perspective that must govern transportation policy if we are to move wisely into the twenty-first century.

The conclusions of the Task Force, which are drawn from the 1989 Final Report, center on the need to:

- more closely integrate transportation and other national goals and policies;
- provide viable options to dependence on the auto;
- retool and redirect federal transportation programs to reflect the above; and,
- increase investment in the nation's transportation systems and services.

The recommendations also serve to strongly reinforce the growing importance of public transportation in the years ahead.

APTA

1992

THE FORCES

In communities across the country, we currently are faced with a daunting array of troubling conditions that are growing to crisis proportions. Our shared experience now includes:

- Intolerable and costly congestion on urban and suburban roads with too many vehicles seeking to use limited roadway facilities;
- Increasing isolation of rural residents, the poor, the elderly, those with disabilities, and willing workers from job opportunities;
- Poisoned air that already threatens the health of nearly 150 million Americans;
- Mounting dependence on foreign oil that has become a threat to national security and a major factor in the nation's trade deficit;
- Sluggish rural economic growth due, in part, to inadequate transportation services and facilities;
- Burgeoning urban and suburban development that has overwhelmed our ability to provide public facilities and services; and,
- Failure of our existing infrastructure, resulting from 20 years of chronic under-investment.

These conditions exist, in part, because our existing national transportation policies and programs are increasingly ineffective in meeting current and emerging needs. Current programs promote separation in the planning and funding of different facilities and they are largely unresponsive to the broader consequences of transportation investment decisions. The inflexible, categorical nature of existing programs limits how we deploy available resources and decreases the cost-effectiveness and efficiency of our investments. We remain bound by a traditional preoccupation with accommodating *vehicles* and an inattention to accommodating *people*. Finally, existing programs have become ineffective due to the lack of adequate funds, generally, and insufficient support for public transportation, specifically.

Our success as a nation in accommodating future demand for travel and mobility will determine whether we can arrest the problems that confront us or whether they will further diminish our national welfare.

In the next 32 years, by conservative estimates, the nation will experience the same increase in total travel that we have experienced in the last 32 years. If we attempt to cope with future growth in travel demand as we have in the past, through overwhelming reliance on single-occupancy, personal vehicles, the crises noted above will accelerate, further undercutting economic growth and our competitiveness as a nation, and degrading the quality of life for millions.

To avoid this prospect we must begin immediately to seek wiser ways to meet tomorrow's mobility needs. If we are successful, our transportation decisions can be decisive in taming the forces that threaten to immobilize us.

"Greater use of mass transit will in turn increase the capacity of our existing roads."—*Rep. Roger Roy, Chairman, Transportation Committee, State House of Representatives, Dover, Delaware*

"... if the largest single source of air pollution in this country is vehicle emissions, does it make any sense to design a federal clean air policy with no effort to entice people out of their cars ... ?"
—*David R. Boldt, Editorial Page Editor, The Philadelphia Enquirer*

"In the United States alone, we could save 33 million gallons of gasoline each day and significantly reduce car air pollution if the average commuter passenger load were increased by one person."—*Andrew Kimbrell, Environmental Law Attorney, Foundation on Economic Trends, Policy Director, Greenhouse Crisis Foundation*

1993

NATIONAL POLICY DIRECTIONS

The initial goals of our past surface transportation programs have been met largely with the completion of the Interstate Highway System and the successful transition of our urban transit systems into mature public services. The problems we confront as a nation and the varying mix of circumstances that arise locally require that we adopt a new perspective and new transportation goals at the national level. New national policy must direct us to invest in mobility rather than in modes, and to use our transportation investments to better serve other critical national goals.

> The availability of the labor force is directly tied to the quality of our transportation systems. Economic development will grind to a halt and our urban areas will decay if we fail to connect workers with work. — *Gilbert Wertzel, Executive Director, Greater Philadelphia Economic Development Coalition*

> "The economic benefits [of transit] will be in less road construction and maintenance, less work time lost to commutes, less destruction from acid rain, and reduced health care costs." — *Carolyn [illegible], American Lung Association of California*

Enhanced Mobility

Enhanced mobility in the movement of people and goods is the fundamental goal to be served by a new generation of national transportation policies and programs.

One of the basic tenets of a new national policy aimed at enhancing mobility must be a commitment to reducing growth in vehicle-miles-traveled ("VMT") and meeting passenger travel demands without necessarily accepting continued, unrestrained growth in vehicle traffic.

The distinction between meeting the needs of passengers vs. accommodating ever-increasing numbers of vehicles is fundamental. We have a diminishing supply of roadway capacity and limited ability, resources, and will to expand our highway network aggressively. Added to this scenario is an increasingly harmful set of consequences associated with our dependence on single-occupany vehicles.

With mobility as our basic goal, national policies and programs should result in a wider array of transportation options tailored to specific markets and designed to dampen growth in vehicle-miles of travel, and increase availability and use of transit and other forms of high-occupancy, shared-ride services.

National policy must be directed to making substantial progress in these terms, in order to better serve our mobility goals.

Integrating Transportation and Other National Goals

Problems of congestion, air quality, energy dependence, declining competitiveness of business and industry, declining rural economic well-being, and isolation of increasing numbers of our people traditionally have been addressed by national policy as independent problems. In fact, they are closely related, and nowhere is this relationship stronger than through the linkage provided by our transportation policies and investments.

One of the foremost challenges we face is to provide for our growing transportation needs in closer coordination with efforts to achieve other major national goals. Transportation investment decisions and the products of our transportation planning must be viewed directly as tools to *increase* economic growth, *clean* our air, *conserve* our energy resources, as well as *improve* mobility. Transportation investments that waste energy, foul our air, dissipate the economic strength, and unravel the social fabric of our communities must be challenged and rejected.

Our success in crafting a new generation of national transportation policies and programs will depend on how skillfully and at what pace we embrace mobility as a goal, and link transportation and other national policies and actions.

WHAT PUBLIC TRANSIT CAN DELIVER

Congestion Relief	Every bus full of passengers at rush hour removes 40 cars from traffic; every full rail car removes 75-125 cars from traffic; every van full of passengers removes 13 from traffic.
Reduced Highway Cost	One high-occupancy vehicle lane carries the same amount of people as three regular highway lanes. Major highways can cost $100-120 million per mile; busways can be built for $4-12 million per mile; light rail for $10-20 million per mile and heavy rail for costs comparable or lower than major highways.
Energy Conservation	A savings of ten to 15 gallons of gasoline is realized every time 40 single-passenger-car drivers take a 10-mile trip to work on the bus. 30-40 million gallons of gasoline would be saved each day if average commuter-vehicle-occupancies were increased from 1.1 passengers per vehicle to 2.1 passengers per vehicle.
Air Quality	When one commuter leaves the car behind and uses transit to travel to and from work for one year, the health of millions of Americans can be improved through the removal of nine pounds of hydrocarbons, 63 pounds of carbon monoxide, five pounds of nitrogen oxides and one pound of particulates, annually.
Safety	The highway death toll—46,644 in 1988—can be reduced, along with 1.8 million annual auto-related injuries.
Economic Growth	Every $10 million in transit capital investment supports 770 jobs; every $10 million in transit operating investment supports 960 jobs. Every $10 million in transit capital investment produces $33 million in business revenues. Every $10 million in transit operating investment produces $30 million in business revenues.

1995

THE FUTURE MISSION AND ROLE OF PUBLIC TRANSPORTATION

The mission of public transportation in the years ahead must parallel closely new national goals and policy directions. Public transportation must serve to enhance mobility and, in the process contribute in a major way to the solution of problems that threaten our economy and quality of life.

In pursuing this mission, transit agencies and professionals will be faced with new and difficult challenges that will require often significant adaptations. The most important adaptations involve broadening the definition of public transit, diversifying services, and shouldering a clear responsibility to manage mobility.

> "Viewed from a state's perspective, it is unacceptable that the federal government should, on one hand, insist upon stringent clean air standards for urban and suburban areas while, on the other hand, reduce its commitment to mass transit."
> —*Robert A. Innocenzi, Acting Commissioner, New Jersey Department of Transportation*

> "Massive highway construction will not ease traffic congestion – but only spread sprawl and congestion to new areas, and increase time lost in congestion, fuel consumption, and smog."
> —*Dr. John Holtzclaw, Sierra Club*

Diversification of Services

To promote enhanced mobility through increased transit use, the conventional definition of transit must be broadened to include a wider range of services tailored to particular markets and drawing on the full range of available resources. High-occupancy, shared-ride services of all types must be incorporated into our concept of public transportation and encouraged, coordinated, and supported through a new federal program.

Managing Mobility: Transit as a Catalyst

Transit agencies and professionals also must act aggressively as catalysts in the community and play a broader role as managers of mobility. This responsibility requires actions beyond the direct operation and management of on-street services. Coordinating, advising, and promoting better management of the supply of and the demand for transportation services are all part of this larger responsibility, including active participation in economic development and land use decisions.

Expanding and diversifying public transit and formalizing the responsibility for managing mobility must be basic strategies for the industry and national policy in the years ahead.

Measuring Success: A Two-Tiered Approach

Improved quality of service, increased performance and greater efficiency remain essential in the provision of transit services, and in the operation of our entire transportation system. The success and value of public transit, however, must be measured in broader terms through a new, two-tiered approach. At the national level, the focus should be directly on how well our transportation investments support achievement of major national goals. At the local level, direct attention must be paid to how those investments serve the unique and varied circumstances, goals, and priorities of the local communities and region. New national policies and programs must emphasize a more strategic view of what must be accomplished both nationally and locally, and provide a framework for measuring progress that is consistent with these broader views.

TEN PRINCIPLES TO GUIDE NATIONAL

As an initial step in reformulating national transportation policy and recrafting federal transportation programs, consensus must be reached on basic principles. To pursue the policy directions highlighted on page 3, the following 10 principles should be used to guide reformulation of the nation's surface transportation programs.

1. **The federal surface transportation program should be restructured substantially in order to address more intelligently the mobility needs of the nation and ensure progress in meeting other national goals.**

   Rationale: Current highway and transit programs do not have the necessary responsiveness nor the flexibility to address current and emerging needs and problems; substantial restructuring makes sense only if done in combination with the addition of significantly increased federal resources.

2. **The concept of transit should be broadened to encompass and promote increased availability and use of transit and other high-occupancy, shared-ride services in order to better serve diverse travel needs, and to reduce growth in vehicle-miles of travel while accommodating increased passenger-miles of travel.**

   Rationale: Federal goals must be stated clearly. Doing so invites closer linkage between mobility goals and broader national goals, it broadens the transit constituency, promotes investment in new mobility strategies and a broader range of services, and promotes relaxation of existing program restrictions. Each step, in turn, increases the attention paid to serving people rather than vehicles.

3. **Existing regional decision-making authority over the use of federal transportation funds should be enhanced and strengthened.**

   Rationale: The local ability to assess needs, set priorities, and deploy resources in a regional context must be strengthened to better serve transportation and other major national and regional goals.

4. **Greater flexibility should be allowed in the use of federal funds and a stronger multi-modal approach to planning, funding, and decision-making must be established.**

   Rationale: Better integration of transportation decisions, planning, and funding is necessary to make appropriate trade-offs between multiple goals and objectives on the local and regional level, to make more cost effective use of resources, and to reduce federal micromanagement of resource decisions and administrative actions that restrict our ability to respond to emerging needs and problems.

TRANSPORTATION POLICY AND PROGRAMS

5. The reliability and predictability of federal funding must be improved through increased reliance on formula allocation, increased reliance on dedicated funding at the federal level, and expanded use of multi-year federal funding commitments.

Rationale: Recipients of federal funds must be able to project and depend on stable sources of support in order to design and carry out multi-year projects and programs; annual uncertainty and delays in establishing the level of federal support for transit and highways must be eliminated.

6. The costs associated with mandated federal actions and the substantial contribution of public transportation to the achievement of other major national goals provides justification for continuing federal support from all sources.

Rationale: The costs of measures required by federal law or policy are substantial and increasing; all sources of support for transit investment should be brought to bear in the years ahead; the linkage of mobility goals to other federal goals is made stronger by the commitment of both dedicated and general funds to support mandated actions.

7. Substantial additional federal funding should be provided for public transportation to fully carry out the goal of significantly increasing the provision and use of high-occupancy, shared-ride services.

Rationale: Federal transit funding has been reduced 50% in the last eight years, in real terms; all indications are that historic disinvestment in transportation, the current condition of facilities, and future travel demands require a doubling of the total investment; the increase should be borne by all funding partners.

8. An immediate gasoline tax/motor fuels tax increase should be enacted concurrent with reauthorization of the Surface Transportation Assistance Act, and federal motor fuel taxes should be made permanent to support needed transit and highway investment; full revenues from the tax should be committed annually.

Rationale: Needs are immediate; the traditional source of transportation funding should continue to be the basic resource for increased investment; aggressive claims will be made by other interests on gasoline tax increases; and, action on federal revenue increases, including the gasoline tax likely will take place sooner rather than later.

9. The federal tax code should be revised to promote private and non-federal investment in transit, and to eliminate the taxation of employer-transit subsidies and other disincentives to transit use.

Rationale: Other federal policies should strongly support direct investment in and use of public transportation, rather than frustrate achievement of the goals that federal funding is intended to meet.

10. Federal transportation policies and programs should require closer integration of transportation investments and land use decisions in order to provide an environment that is conducive to and encourages increased provision and use of high-occupancy, shared-ride services; other federal policies affecting transportation demand and investment should incorporate this same objective.

Rationale: Unless development practices and policies at the local level are consistent and supportive with basic federal transportation goals, the effectiveness of federal investment will be diminished greatly along with the opportunity to advance other national goals. Federal attention to how land uses and development are arrayed across the landscape is necessary to reinforce these linkages.

ELEMENTS OF A NEW NATIONAL SURFACE TRANSPORTATION PROGRAM

A new national surface-transportation program to support transit and highway investment in the decades ahead must deliver resources more effectively and directly to both our metropolitan and rural regions. Outlined at right and on the following three pages are specific program proposals that can achieve this objective.

"Dollars put into transit infrastructure create growth and wealth. On the other hand, failure to invest will lead to noncompetitiveness at home and in world markets." —*Roger Tauss, Transport Workers Union.*

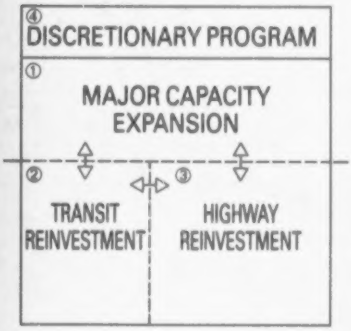
"Mobility and productivity are synonymous." —*John A. Miller, Chairman and CEO, Provident Mutual Life Insurance Company.*

The Metropolitan Program

A new Metropolitan Transportation Program at the federal level is proposed to support transit and highway investments in the nation's urbanized areas of greater than 50,000 population. The Metropolitan Program is composed of four elements:

1. A federal source of formula funds for major expansion of either transit or highway capacity, giving local officials the flexibility to decide what mix of projects and investments best suit the local need to expand capacity;
2. A formula program to support continuing reinvestment in existing public transit systems and services;
3. A formula program to support continuing reinvestment in our highway system; and
4. A federal discretionary program targeting federal investment to major capital projects, either transit or highways.

A specific metropolitan focus has become essential and the federal-local relationship in meeting emerging needs must be strengthened. At the metropolitan level the complex interrelated issues of central city and urban-suburban development and travel can be attacked comprehensively, and the full spectrum of regional economic, social, and environmental relationships can be brought most effectively into balance. Also, at the metropolitan level we have the greatest breadth of data and information with which to shape our strategies and gauge our success.



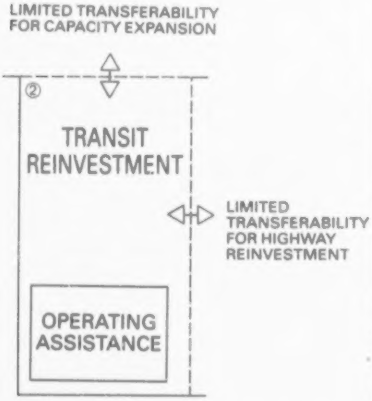
Targeting Modal Reinvestment—The federal program must provide resources specifically targeted for critical maintenance and reinvestment. In doing so, it is appropriate to continue to allocate funds directly by mode.

Providing separate transit and highway reinvestment funding recognizes that one of the most profound problems facing our nation's transportation system is the degree of deterioration that has been allowed to take place. Very simply, we are failing to adequately maintain our current systems and facilities. The backlog of investment requirements for maintenance and upkeep is both staggering and mounting.

As importantly, both transit and highway reinvestment needs are easily measured, have high public visibility, and have far-reaching consequences if not aggressively addressed.

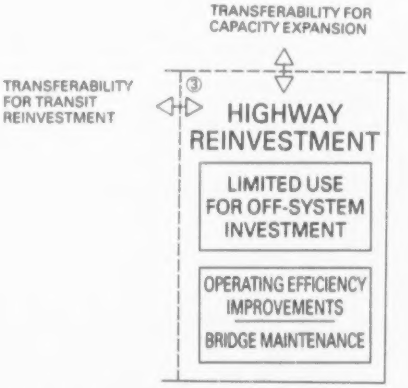
The proposed Metropolitan Program, therefore, includes separate program elements to provide federal funds specifically for both transit and highway reinvestment.

The major features of each of the four major components of the metropolitan program are described in the accompanying figures.



LIMITED TRANSFERABILITY FOR CAPACITY EXPANSION
②
TRANSIT REINVESTMENT
LIMITED TRANSFERABILITY FOR HIGHWAY REINVESTMENT
OPERATING ASSISTANCE

- DEFINE TRANSIT MAINTENANCE AND REINVESTMENT TO INCLUDE:
  - Capital investment needed to replace and rehabilitate current equipment and facilities
  - Capital investment necessary to retain current market share
  - Transit operating support
- DELIVER FEDERAL FUNDS FOR TRANSIT MAINTENANCE AND REINVESTMENT TO CURRENT "DESIGNATED RECIPIENTS"
- USE OF EXISTING ALLOCATION FORMULA (population and service factors)
- ALLOWANCE FOR LIMITED TRANSFERABILITY OF FUNDS FOR SELECTED HIGHWAY REINVESTMENT PROJECTS AND CAPACITY EXPANSION
- ELIMINATE CAPITAL/OPERATING DISTINCTION FOR SMALL- AND MEDIUM-SIZE URBANIZED AREAS



TRANSFERABILITY FOR CAPACITY EXPANSION
TRANSFERABILITY FOR TRANSIT REINVESTMENT
③
HIGHWAY REINVESTMENT
LIMITED USE FOR OFF-SYSTEM INVESTMENT
OPERATING EFFICIENCY IMPROVEMENTS
BRIDGE MAINTENANCE

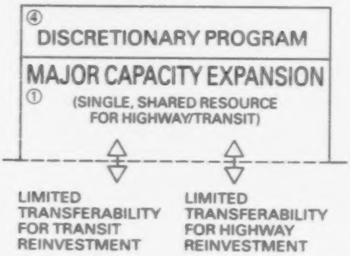
- DEFINE HIGHWAY MAINTENANCE AND REINVESTMENT TO INCLUDE:
  - All investments on a designated metropolitan system, including Interstate highways, short of added lanes
  - Investment to improve operating efficiency, and bridge maintenance on a metropolitan system
- DELIVER FEDERAL FUNDS FOR HIGHWAY MAINTENANCE AND REINVESTMENT TO STATES WITH DIRECT PASS-THROUGH TO METROPOLITAN AREAS
- USE EXISTING FEDERAL AID URBAN SYSTEM FORMULA
- METROPOLITAN RECIPIENT TO BE AGENCY RESPONSIBLE FOR CAPITAL PROGRAMMING
- ALLOW TRANSFERABILITY FOR:
  - Limited transit-related improvements
  - Limited priority highway improvements off the designated system

Expanding Capacity—In addition to funds provided specifically for reinvestment, the proposed Metropolitan Program includes a separate source of funds to directly support major capacity expansion on metropolitan systems. Unlike metropolitan funds provided for reinvestment, federal funds for capacity expansion would be available to the metropolitan area as a shared or pooled resource, for use without regard to mode.

The single, multi-modal source of funds for major capacity expansion is intended to encourage stronger integration of transit and highway planning, to promote more rational trade-offs between various types of investments, and to encourage more highly integrated multi-modal project design.

Long-deferred reinvestment needs cannot be pursued to the exclusion of efforts to expand both transit and highway capacity. Travel demands already are overwhelming our systems and will continue to increase in the years ahead. Additional passenger-carrying capacity will be essential to maintain a mobile America into the next century and beyond.

THE MAJOR CAPACITY EXPANSION AND DISCRETIONARY PROGRAMS



④
DISCRETIONARY PROGRAM
MAJOR CAPACITY EXPANSION
①
(SINGLE, SHARED RESOURCE FOR HIGHWAY/TRANSIT)
LIMITED TRANSFERABILITY FOR TRANSIT REINVESTMENT
LIMITED TRANSFERABILITY FOR HIGHWAY REINVESTMENT

- COMBINED FEDERAL RESOURCE: NO DISTINCTION REGARDING MODES; ALLOW TRANSIT/HIGHWAY MIX OF CAPACITY EXPANSION INVESTMENTS/PROJECTS TO BE DETERMINED LOCALLY
- DEFINE MAJOR CAPACITY EXPANSION TO INCLUDE:
  - Transit new starts and extensions (rail, transitway, HOV, etc.)
  - Highway extension and expansion (i.e. added lanes, new facilities on new rights-of-way)

- FORMULA DISTRIBUTION BASED ON:
  - Need: Travel demand growth, using annual data in an easily auditable form.
    e.g. motor vehicle fuel sales
    federal gasoline tax revenues
    attributable motor vehicle registrations, etc.
  - Transit Use: Proportion, amount or increase in travel accommodated on transit and other forms of high-occupancy, shared-ride services, using annual data in an easily auditable form.
    e.g. ridership
    farebox revenue/base fare
    increase in average vehicle occupancy, etc.
  - Weight the transit use factor more heavily as the preferred outcome to be rewarded/encouraged
- FEDERAL DISCRETIONARY RESOURCE
  - Devoted to projects that serve directly to improve or address issues of national significance, e.g. congestion, safety, air quality, economic development, infrastructure, energy, etc.

Federal Discretionary Investment—The proposed Metropolitan Program is designed to function predominantly through a formula allocation of federal funds drawn from motor fuel and related federal user fees. For a variety of reasons, however, it will remain important to maintain a discretionary program at the federal level.

Federal discretionary funds should be available to support either reinvestment or capacity expansion projects. Federal discretionary funds should be directed to projects that cannot be accomplished with formula funding alone and which provide demonstrable, positive impacts in the solution of problems declared to be of national significance. Obvious examples include projects that reduce vehicle-miles of travel, provide congestion relief, reduce mobile source emissions, relieve safety hazards, directly spur economic development, expand service to the elderly, those with disabilities, or disadvantaged persons, or attract added sources of non-federal funds.

Increased Flexibility—One of the principle features of the Metropolitan Program is the greatly increased flexibility that is provided in the use of federal transportation funds. The added flexibility occurs at several levels within the program.

By eliminating most current federal categorical programs, existing constraints on the use of federal funds are relaxed considerably, creating a more responsive and effective federal program. In addition, the provision of a single, multi-modal source of funds for major capacity expansion greatly increases the variations in how federal funds can be deployed within the metropolitan region.

Increased flexibility also is provided by allowing a degree of transferability between funds specifically dedicated for reinvestment and funds provided for capacity expansion. In addition, a significant degree of flexibility is provided in the use of funds within each of the major program elements.

Finally, a continued federal discretionary program provides the flexibility needed to carry out major capital projects beyond the scope of formula programs.

A Rural Public Transportation Program

The transportation needs of residents of small urban and rural areas across the country are as immediate and as compelling as those that confront the residents of our largest metropolitan areas.

While significant restructuring of the current federal transit program serving small urban and rural areas below 50,000 population may be necessary, there are some changes in federal policy that are evident today that will be essential in making the rural transit program more effective, and would allow for more efficient use of federal funds.

The most important change is an increase in the level of federal support. The federal small urban and rural transit assistance program could easily benefit from at least a doubling of federal investment.

In addition to increased direct federal investment, one of the most important actions that can be taken to increase the effectiveness of available funds is to streamline and coordinate the use of federal transportation funds with the massive amounts being spent through federal (and state and local) human services programs for transportation of specific client groups.

Updating national policy and programs directed at the mobility needs of small urban and rural residents must go hand-in-hand with enactment of a new metropolitan transportation program.

"We're running up against the physical limits. . . . The goal has got to be shifted away from moving vehicles to moving people." — *Ross Sandler, NYC Transportation Commissioner, New York Times, July 17, [illegible]*

"If we allow our [illegible] position to [illegible] the [illegible] of American cities, we cannot expect to have a healthy and internationally competitive economy." — *Bruce T. McDowell, [illegible]*

"The preservation of our existing network of commuter rail service is essential to our economic future. We must have a stable funding base for capital needs and operations." — *[illegible] Chairman, [illegible] Real Estate [illegible]*

"It is vital that the federal government continue its partnership with local, state and private [illegible] the [illegible] of our nation." — *[illegible] County, Transportation [illegible]*

TRANSPORTATION INVESTMENT REQUIREMENTS

The most important tool in addressing the goals and objectives of a new federal transportation program is the level of direct investment made in our systems and services—both transit and highways.

National policy must be focused on restoring the priority of transportation investment nationwide. To do so, the federal government must re-establish its leadership role in providing increased investment in future years.

Today there is strong concensus and justification for the proposition that overall transportation investment should be increased substantially and that the share of the investment from federal sources should not be reduced from levels reflected in current federal policy.

> Our federal tax system promotes the use of the single occupant vehicle as the best way to get to work. We are sending a mixed signal to commuters. The single occupant vehicle is no longer the mode of choice. — *Rep. Roger Roy, Chairman, Transportation Committee, State House of Representatives, Dover, Delaware*

> More, not less, public money needs to be spent at the federal, state, and local levels for the improvement, maintenance, and expansion of mass transit. . . . Mass transit is something positive government can do to protect air quality, conserve energy, promote desirable land use patterns, and provide access to jobs and convenient, safe travel. It's hard to think of a government spending program where so much bang can be gotten for the buck. — *Joanne R. Denworth, Executive Director, Pennsylvania Environmental Council, Inc.*

FEDERAL INVESTMENT: THE METROPOLITAN PROGRAM

Transit 2000 estimates confirm the need to increase combined federal investment in transit and highways by 100% or more. Today U.S. Department of Transportation spending includes $16.7 billion annually, $3.2 billion for transit and $13.5 billion for highways. The recommended Metropolitan Program calls for a total federal transportation investment of not less than $25 billion per year and as much as $34 billion, based on combined estimates of transit and highway needs.

Transit Investment Requirements

As part of the Metropolitan Program, federal investment for public transportation should be increased to at least $11 billion annually, including roughly $5.7 billion for essential reinvestment and $5.2 billion for capacity expansion.

This estimate has been derived from well-defined reinvestment requirements that reflect the mounting backlog of repair, replacement, and rehabilitation needs of our public transit systems.

Added to the essential reinvestment needs are the costs of expanding transit capacity to meet the goal of substantially increasing the use of transit and other forms of high-occupancy, shared-ride services. Capacity expansion needs have been estimated from analyses that generally target a level of transit use that is double or triple the current level. Increases of this order of magnitude or greater represent a reasonable goal for the nation and would, for instance, reflect a commitment to achieve per capita transit use at levels equal to those currently experienced in Canada.

The basic assumptions used in arriving at the transit investment requirements are conservative. They reflect:

- a commitment to reduce the current backlog of transit reinvestment requirements;
- a parallel commitment to reinvest adequately in our transit systems and facilities in the future to support a regular cycle of rehabilitation and replacement;
- pursuit of future per capita transit ridership goals that, at a minimum, double current levels;
- substantial increases in the proportion of transit trips on non-traditional, shared-ride types of services; and
- cost factors that reflect the current median costs of various service options.

A more ambitious set of ridership goals and cost estimates adjusted for future inflation would require a level of federal investment in transit signficiantly above the $11 billion annual figure.

Even without a national commitment to increased transit ridership, however, the federal transit program must be increased from $3.2 billion to a range of $6 billion to $8 billion per year. This *minimum* level of federal transit investment is necessary to meet the reinvestment requirements of existing systems and services, to continue major new projects that already are in the advanced stages of planning and development, and to fulfill new federal requirements and mandates in a host of areas. The $6 billion to $8 billion annual level of investment is necessary to restore recent declines in the purchasing power of federal assistance as a result of inflation and program reductions since 1981. In 1981, federal transit assistance totaled $4.6 billion. Simply adjusting that level of support to 1989 dollars would require a minimum federal program of $6.5 billion annually to meet a minimum combination of reinvestment and capacity expansion needs.

Highway Investment Requirements

Depending on the assumptions used, figures compiled by the American Association of State Highway and Transportation Officials (AASHTO) indicate a need for federal highway reinvestment that ranges from over $8 billion annually to nearly $13 billion. Federal support for highway capacity expansion could require an additional $10 billion per year if scenarios for 'fully improved service' on the nation's highways are to be pursued.

FEDERAL INVESTMENT: THE RURAL TRANSIT PROGRAM

As indicated earlier, the need for public transportation services in our nation's small urban and rural areas far exceeds current resources. Federal assistance directly to rural public transit should be at least double the $70 million to $80 million now provided annually. In addition, the substantial amounts of transportation spending from federal human services programs should be combined more effectively with direct investment by the federal Department of Transportation.

The scope of our transportation needs is enormous. The consequences for the nation of not acting aggressively to meet them is increasingly serious. As a result, the federal government must be called on once again to take the lead role, not only in setting goals and establishing new policy direction, but in providing the necessary financial resources to spur overall transportation investment.

NON-FEDERAL FINANCE

While increased direct federal transportation investment must be the centerpiece of a new national policy, overall transportation investment has been, and must remain, a partnership among federal, state, and local governments, the private sector, users, and others that benefit from enhanced mobility and high quality systems and services.

Direct federal investment in transit and highways must serve two purposes. First, it must directly underwrite major projects and improvements. As importantly, however, federal investment must serve as a catalyst to attract stable and reliable financial commitments from each of the other partners. The goal of bringing added non-federal resources to transportation should be a prominent part of new national policies and programs.

The most effective way to serve this goal is to incorporate into federal policy and programs a comprehensive series of fair and equitable incentives to attract greater state and local funding, increased financing from private sources, and increased financial participation by users and beneficiaries. As part of this effort, consideration should be given to new pricing mechanisms that recover more of the costs of services and facilities, particularly for automobile and highway use, and federal allocation mechanisms that reward increased investment without placing at a disadvantage communities that may be struggling economically.

In addition to the provision of more effective financing incentives, an effort must be made to remove the current disincentives to increased transportation investment that exist in federal policy. Transit agencies, for instance, must be allowed, encouraged, and rewarded for seeking increased revenues from non-traditional sources, including new types of services, real estate and development activities, etc.

Our future transportation needs—both transit and highways—require a comprehensive financial strategy guided and underwritten by the federal government.

ACTIONS AND POLICIES TO SUPPORT NATIONAL GOALS AND INCREASED TRANSPORTATION INVESTMENT

It is increasingly important to ensure that our transportation investments are supported strongly by other public policies. Today unfortunately, a number of public policies, including federal tax provisions, national energy policy, and local land use and development controls severely undermine the effectiveness of our transportation investments. Those policies should be eliminated and incentives to increase the effectiveness of our transportation investments should be adopted.

> "Industry concurs with the finding that calls for an increase in direct investment in transportation from all sources." *—Richard B. Griffin Jr., director of government relations, General Signal Corporation*

> "Rather than highway funding sanctions, (Clean Air Act) non-attainment areas should be eligible for and granted funding to be utilized for systems that would reduce vehicle miles traveled, namely mass transit." *—Sara R. Nichols, Clean Air Council of the Delaware Valley, Philadelphia*

Federal Tax Provisions

Current federal tax provisions limit overall investment in and the effectiveness of transportation facilities, particularly public transportation services. A host of federal tax provisions discourage private investment in transportation facilities, greatly restrict the financing powers and options available to state and local governments, and raise the cost of state and local borrowing for infrastructure investment.

Current tax provisions governing state and local bonding ceilings, private participation limitations, arbitrage restrictions, sale/leaseback transactions, etc. should be reviewed carefully and made consistent with new national transportation goals and policies.

In addition, fringe benefit provisions of the federal tax code provide a significant economic incentive to automobile users and a disincentive to increased transit use. Current tax law allows employer-subsidized free parking to go totally untaxed while those who receive employer-subsidized transit passes are taxed fully, once the value of monthly employer support exceeds $15 dollars. This imbalance must be remedied.

As part of the effort to rewrite federal transportation programs and policies, federal tax law must be rewritten to support rather than undermine greater investment and use of public transportation.

Land Use and Development Coordination

Land development patterns dictate the nature of our travel demands. To enhance mobility and freedom of movement, greater attention, therefore, must be paid to how land uses and development are arrayed across the landscape. It is imperative that we aggressively promote and provide incentives for development that can be served more easily and effectively by public transportation. Concentrating development, more mixed-use development, supportive parking requirements, policies, and pricing, and attention to a host of critical site and building design features are all required.

Better coordination of transportation and private development through local planning and development controls presents enormous opportunities to manage travel demand, reduce public investment requirements, share costs, and achieve greater use and efficiency from all our transportation facilities and services.

Across the country there are a growing number of examples of how this is being done. New federal transportation programs should promote these efforts and ensure that both transit and highway investments are premised on broad-based strategic plans for the region and on the existence and implementation of effective land use plans and development controls.

National Energy Policy

Among the most significant factors affecting our choice of transportation options is the cost of various modes of travel, both to the rider and to the community as a whole. Today, as an expression of unstated national policy, we price gasoline at levels far below those that exist in other countries around the world. We in essence subsidize and, therefore, directly encourage low-occupancy automobile use.

At the same time that we are providing an economic incentive for increased low-occupany automobile use, we fail to recover the full cost of automobile use or account fully for the consequences of reliance on personal vehicle use. We have held the price of energy artificially low and have grossly underestimated the costs that must be borne.

National transportation and energy policy must be closely coordinated and brought into synch with respect to these two crucial points before the marketplace will promote the type of activity and behavior that is required to achieve our mobility goals as well as other major national goals linked to transportation.

Human Resources, Technology and Research and Development

Human resource issues, technological change, and our approach to basic research and development all will have substantial impacts on transportation demands, travel behavior, and the success of strategies we select to meet future transportation needs.

Human Resources.—Public transit will continue to be dominated by its human resource and human service character. Two dimensions are of critical concern with respect to national policy: the way in which demographics will influence travel demand, and how transit's work force can be shaped to best meet those demands.

Socio-economic and demographic trends indicate a serious, across-the-board labor force shortage in future years. The problem is compounded by the increasing separation of willing workers from the job opportunities. Labor force mobility will become an increasingly important issue throughout the entire country under these conditions. As a consequence, greater attention must be paid to: land use and transportation strategies that bring jobs and housing locations into better balance; and make expanded transportation options available to the work force.

Because of the labor-intensive nature of public transportation, the quality of transit services is dependent directly on the skills that are brought to bear by both labor and management, the price paid for those skills in a highly competitive environment, and the degree to which those skills are used to their greatest potential.

A variety of new recruitment, education, and retraining strategies as well as benefit and compensation programs may need to be tailored to an increasingly heterogeneous work force that will be more multi-lingual and will be seeking a new balance between household, family, and job-related responsibilities.

National transportation policy and the transit industry must value and serve this increasing diversity to ensure the successful pursuit of the transit mission.

Technology.—New technologies also will affect public transportation in two ways: by influencing changes in travel and communications patterns; and, by effecting the nature of transit equipment and the skills necessary to put it to its most effective and efficient use.

A central feature of national concern is the strength of the domestic transit supply industry. The responsibility of transit managers is to get greatest value and reliability for their investment. This basic requirement must be balanced against both the need to maintain strong, competitive domestic suppliers, and the need to reduce the nation's mounting trade deficit.

Transportation policy must be integrated with national and international economic policy, and the federal government should take a more active role in joint efforts to support and promote the domestic transit supply industry here and abroad.

Research and Development.—Common to both the human resources and technology issues is the chronic underinvestment in research and development in the transportation field, generally, and in public transportation specifically. One of the most effective means to reinforce a strong market for goods and services is to ensure the existence of a strategically-targeted research and development program.

Today, there is limited incentive, however, for domestic suppliers or for potential workers to commit themselves to participate in the growth and evolution of the nation's transit industry. National policy must, through a greatly expanded emphasis on research and development, help provide the incentives and bolster the market for innovative services, management, and technologies.

SUMMARY

We have reached a point as a nation where the host of policies that guide and impact future transportation investment must be reformulated. The proposals made by the Transit 2000 Task Force represent a fundamentally new and broad-based approach to ensure that future transportation investment more effectively serves national and local goals. Substantial progress in crafting a new set of policies and programs consistent with the directions proposed by the Task Force will help ensure the vitality of our economy and the quality of life in our communities in the decades ahead.

TESTIMONY

Surface Transportation Program Reauthorization

September 17, 1990

Presented by:

Dewey F. Pearman
V.P. Governmental and
Legislative Affairs
Northwest Indiana Forum, Inc.
8002 Utah Street
Merrillville, Indiana 46410

Mr. Chairman, members of the Committee, my name is Dewey Pearman, I am Vice President for Governmental and Legislative Affairs for the Northwest Indiana Forum. The Forum is a regional economic development organization working in Lake, Porter and LaPorte Counties, Indiana. We are a coalition of the business, government and labor leadership of Northwest Indiana. On behalf of our officers, directors and members, I would like to thank you for the opportunity to present our views on the reauthorization of the Surface Transportation Act. The mission of the Northwest Indiana Forum is to turn the assets of Northwest Indiana into a competitive advantage that will encourage stable, balanced and steady economic growth. Our vision is to create, through this growth, a community with a strong image nationally, in the State Capitol, and in the eyes of our own people. Working together with local businesses, the Forum strives to make this competitive advantage known to those with the potential to expand and relocate within Northwest Indiana. Pursuit of this mission requires us to recognize the important relationship between sound public policy, particularly with respect to the adequate financing of public infrastructure and the ability of communities to stimulate private capital investment and job creation. Our staff of economic development professionals work daily with local companies that are considering making major capital investments in plant and equipment in Northwest Indiana. As we work with these companies to help them make the decision to invest in Northwest Indiana we very often hear expressions of concern for the ability of the local transportation infrastructure to support the needs of business. We believe there to be a strong and direct relationship between the quality of roads and highways, the quantity and quality of public transportation systems, and ability of communities to retain and stimulate private capital investment in plant and equipment. We believe this is a relationship the business and governmental leadership of Northwest Indiana fully understands. Several months ago we undertook a survey of our members to help us determine our public affairs priorities. The results of that survey clearly demonstrate that our membership, is acutely concerned with the issues being considered by this committee today. Based on the results of this study, we have identified the adequate financing of transportation infrastructure, including roads and highways and mass transit to be our top public affairs priority. As such, we have joined with the Northwestern Indiana Regional Planning Commission in an effort to identify a major new funding source for these types of projects. That effort, "Operation Bootstrap", is being directed by a public/private, non partisan Task Force which is in the process of developing a proposal for addressing local infrastructure needs. We believe that Task Force will, in the next several weeks, finalize a series of recommendations which will include the imposition of a 1%, three county sales tax which would be used to finance the infrastructure needs of cities, towns and counties in the region and to finance mass transit operations. Our support for such a tax increase is demonstrative of our concern for additional financing in these areas and a recognition of limited state and federal resources. We believe such local initiatives are becoming critically important to the economic future of our community. However, our intent in encouraging greater local effort is not to replace state and federal funding, but rather to make Northwest Indiana more competitive in attracting funding from other sources. We, locally, are willing to do our part to enhance Northwest Indiana's ability to attract capital investment but feel it is critically important to have the federal government as a full partner in this effort. We fully appreciate the pressure being placed on the federal government and the need for significant budget reductions. But, our experience in working with companies making capital investment decisions tells us that public investment in roads, highways and public transit systems will stimulate private investment and job creation. Again, thank you for the opportunity to present our comments on this proposal.

WRITTEN TESTIMONY OF

JAMES E. RANFRANZ
EXECUTIVE DIRECTOR
NORTHWESTERN INDIANA REGIONAL PLANNING COMMISSION
8149 KENNEDY AVENUE
HIGHLAND, IN 46322

BEFORE THE
INFRASTRUCTURE FIELD HEARING
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

MUNSTER TOWN HALL
MUNSTER, IN 46321

SEPTEMBER 17, 1990

Mr. Chairman and Members of the Committee:

I thank you for traveling here today to listen to what we, in the First District of Indiana and in this part of the Midwest, feel is important relative to the reauthorization of the transportation program. In my opinion, you could not have traveled to a better place to discuss transportation issues for nearly every conceivable mode of transport is present in Northwest Indiana and so are many examples of successes, failures and opportunities in the movement of people and goods. We have a busy international port, Burns International Harbor; the Nation's only electric interurban commuter rail system, the South Shore Railroad; the State's busiest highway, the Borman Expressway; and a candidate site for Chicagoland's 3rd major airport now under study, the Gary Regional Airport.

This year, the States of Illinois and Indiana, together with the Metropolitan Planning Organizations (MPO's) in Northeastern Illinois and Northwestern Indiana are carrying out a significant planning activity at the specific request of the US Congress. The I-80/94 Congestion Relief Study is searching for solutions to the severe traffic congestion that occurs on this vital highway.

Several proposals aimed at promoting smoother traffic flow have been put on the table for discussion and analysis. Among the alternatives are the construction of express lanes, and new highways, and changes in the toll policies on I-90 (the Chicago Skyway and Indiana Toll Road) and I-80/94 (the Borman Expressway). While some of these solutions may end up being very costly, the do-nothing alternative will have its own costs, in the form of non-movement of commerce, wasted fuel, and air pollution that would continue to keep this urban area in non-compliance with the National Ambient Air Quality Standards (NAAQS).

The I-80/94 Congestion Relief Study is one example of the Comprehensive, Cooperative, Continuing (3-C) planning process, that the Northwestern Indiana Regional Planning Commission (NIRPC) conducts, as prescribed by the current surface transportation regulations. The Comprehensive planning process balances the social, environmental, and economic forces that batter the transportation system. The Cooperative nature of the process involves the federal, state and local governmental entities in every aspect of the development and maintenance of the system. The Continuing nature keeps the process in tune with the changing character of the transportation needs and the development of the region. The I-80/94 Congestion Relief Study is generating new technical planning capabilities in Northwest Indiana. The 3-C process must be retained and strengthened.

MPO's have an important role in the decision-making process with respect to the allocation of Federal-Aid Urban System Funds, and mass transit Section 9 Funds, and in the programming of all federal funds for the region. This role should be retained with respect to the proposed flexible system, and these decisions must continue to be based on a comprehensive regional intermodal transportation plan.

We understand the value of, and need for a joint, cooperative process involving local governments through the MPO's for the planning, programming, and designation process for the proposed **Highway System of National Significance (HSNS).** In the event a categorical program, such as the HSNS is accepted by Congress, any designation process, as well as program and project prioritization should be accomplished through a strengthened 3-C process with joint determination by local governments acting through their MPO's and the state.

The proposal for combined funding for highways and transit would place a greater reliance on the forum provided by the MPO's. MPO decisions must be based on a technically sound planning process. The tools for analysis are not without cost. The acquisition of accurate and adequate data for quantifying the distribution of transportation demand is so expensive that it is rarely done in a complete manner. MPO's are acquiring computer equipment and software, but the training and retention of competent and qualified staff are beyond the means of most MPO's. Even the logistics of coordination can be a severe burden on the MPO's. Clearly, the MPO's need the financial resources to maintain and enhance the technical process. Financial pressures from all levels are squeezing the MPO's to a less-than-bare-bones operation.

There has been serious discussion of a restructuring of the funding delivery mechanism for UMTA planning funds, similar to the FHWA's planning program. Currently, the UMTA Section 8 planning program is a direct federal - local grant program. Under the FHWA model, the program would be administered through the states. Northwestern Indiana would be among those experiencing the elimination of direct grants which would be replaced with a state pass-through system. We feel that interjecting the states in the funding delivery would unnecessarily impose additional strings as well as administrative costs on the metropolitan transit planning process.

We understand that a new approach being proposed for transit planning and research would yield an increase in funding but only a minor increase in Metropolitan Planning Organization funding. A restructuring of future planning may also broaden the activities eligible for funding. We agree that an increase in responsibility would serve our localities and region well, but are concerned that the net result of this restructuring would require MPO's to do much more with only a slight increase in funding.

Congress is effective at passing laws but not at following-through with revenue capability to adequately respond to those initiatives. Examples are the Clean Air Act and the Americans with Disabilities Act. Whatever good these laws do for the environment and for humanity, they are very costly to implement. The funds for implementation are not provided. Further, local government in Indiana is constrained in its ability to raise revenue to respond, and the property tax system is stretched beyond its capacity to deal with infrastructure financing. Our General Assembly has yet to pick up the ball tossed by Washington to the states.

Faced with the uncertainty of adequate levels of funding from the federal and state levels, we in Northwestern Indiana have taken the initiative, and begun to form a potential mechanism to fill in some of the gap. NIRPC and the Northwest Indiana Forum, which represent the public and private sectors, have joined forces and created **"Operation Bootstrap"**. This effort has identified the infrastructure needs of the region that are currently faced with inadequate funding, and has identified potential revenues to be generated by local funding strategies. The revenue estimates would not be sufficient to replace the needed federal and state investment, but would supplement the federal and state programs by providing the required matching funds, and funding for projects that are currently not eligible for federal or state funding. In order for this effort to work, state restrictions on the ability of local and regional units of government to raise the needed revenues must be removed.

We are uncertain of the impact of the designation of a Highway System of National Significance and whether the emphasis of a state or a region should be on it or on the flexible system, which is being considered, as a category for most local projects. We do know that the HSNS would have higher design standards, therefore, higher costs for land acquisition and construction. Stricter standards would produce a system of more suitable roads but at a higher price.

The Highway System of National Significance may be a 75%-25% match, where the more local, flexible system could be a 60%-40% match. This would mean a lesser ability to access federal money due to a higher local share, and would cause a significant negative impact on local units of government.

Northwestern Indiana is faced with the same problems that plague most urban areas. Rapid development in the outlying areas is using up most of the available land needed immediately for critical transportation corridor development. Immediate acquisition of transportation corridor rights-of-way is essential when highways and commuter rail systems must be built to reduce congestion on highways.

We must find more effective ways to utilize existing transportation facilities and to better manage transportation demand. It is through the metropolitan transportation planning process that scarce resources available to transportation are directed to maximize efficiency and capacity of the system. It is through the metropolitan planning process that competing economic development, environmental and social priorities are reconciled and balanced with mobility needs. The investment required to adequately fund the process is minimal, but the payoff is substantial. In fact, in his "National Transportation Policy", DOT Secretary Samuel Skinner states:

> "Regional planning is essential to ensure integrated transportation systems, as well as to organize effective programs for attaining metropolitan area air quality goals and other region-wide objectives in transportation."

Secretary Skinner further indicates that:

> "It is Federal transportation policy to increase emphasis on integrated state, local, and regional transportation planning and investment decisions", and to "strengthen the role of MPO's or equivalent planning bodies in programming and prioritizing transportation projects."

We applaud the administration's recognition of the current and potential role of MPO's in assuring effective transportation programs for metropolitan areas, and we hope you share this view as well.

We believe that there is a critical role which transportation planning plays in developing and implementing truly effective transportation programs in our nation's urbanized areas, continued investment in transportation planning is more vital than ever to federal, state, regional, and local interests.

In our area, as in all metropolitan areas, transportation systems are vital components of our regional economies. The federal government, along with the states and localities must continue to ensure the long-term vitality of our regional communities.

We stand ready to assist you further in the coming months as you continue your deliberations on these important matters.

Thank you!

Testimony

of

David S. Williams

Commissioner

of the

Department of Public Works

on behalf of

The City of Chicago

before the

U.S. House Public Works and Transportation Committee
Hon. Glen Anderson, Chairman

Field Hearing
on
September 17, 1990
in
Munster, Indiana
concerning
Elements to be Authorized
in
The 1992 Surface Transportation Act

Mr. Chairman and members of the Committee:

I am David S. Williams, Commissioner of the Department of Public Works of the City of Chicago.

The City of Chicago is responsible for the Chicago Skyway, a designated segment of Interstate 90. The Skyway is a 7.5 mile toll bridge facility on the southeast side of Chicago connecting the Dan Ryan Expressway (Interstate 94) with the Indiana Toll Road which is Interstate 90 in Indiana. The Skyway currently carries approximately 20,000 vehicles per day, which is less than half of its capacity. The nearly parallel Calumet Expressway, which is a toll-free facility, carries about 80,000 vehicles per day and is severely congested on a regular basis.

The Skyway was constructed with revenue bonds in 1959 at a cost of approximately $101 million dollars. Its current traffic volumes generate approximately $15.8 million a year in toll revenues. The $15.8 million is allocated as follows:

$3.6 million	for interest on debt of $101 million
$5.5 million	for capital rehabilitation
$5.5 million	for operating costs
$1.2 million	for insurance
$15.8 million	total

The toll revenues have never been, nor are they ever projected to be, sufficient to pay the principal. The Skyway tolls are $1.75 per car and average $5.00 per truck. Up until this year, tolls have been regularly raised by court order to assure payment of interest to the bondholders, but the court rejected the bondholders' latest request to raise the tolls to $2.00 per car because any further increase would be counter-productive, that is, fewer vehicles would use the Skyway and total revenues would decline.

The $101 million in principal owed to the bondholders remains outstanding and will remain outstanding until a new funding mechanism is found.

In addition to the principal, the Skyway needs $75 to $100 million in major capital rehabilitation work. Although the Skyway is a designated segment of Interstate 90, it is not eligible for Interstate 4R funding because the State of Illinois and the City of Chicago are required by federal law to enter into an I-4R funding agreement before these funds could be made available for the Skyway.

While the City is faced with the need to maintain and improve the Skyway and to pay off its bonds, the State of Indiana is facing severe congestion on the Borman Expressway which parallels the lightly used Indiana Toll Road. The City is a participant, along with the Illinois Department of Transportation and Indiana, in a federally-financed study of how best to relieve the congestion on the Borman Expressway. One of the solutions being studied is to pursue a Skyway toll reduction or elimination strategy to divert traffic from the Borman to the Skyway/Indiana-Toll Road route. This approach could be the cheapest, fastest way of alleviating the existing traffic congestion on the Borman. Eliminating Skyway tolls would require retiring the bonds. Thus in one action, the Skyway's financial problems and Northern Indiana's congestion problem could be relieved.

The Interstate congestion/underutilization problem in northwest Indiana and the adjacent Chicago urbanized area in Illinois is probably unique in that the narrow corridor on the southern shore of Lake Michigan has one Interstate that is toll-free and a somewhat parallel Interstate, the Skyway/Indiana Toll Road. While the motoring traveller can save about 20 miles or 20 minutes of travel time by taking the Interstate 90 alternative, it will cost him just over $2.00 in tolls ($1.75 for the Skyway part and $.90 for the Indiana Toll Road part of Interstate 90). It is obvious that underutilization of Interstate 90, because of the tolls, is contributing to the congestion on the toll-free Interstate 80/94 Borman Expressway. It is unusual to have toll Interstate facilities and toll-free Interstate facilities in the same corridor competing with each other.

We would greatly appreciate your attention to this Interstate congestion/underutilization/funding problem in the 1992 re-authorization act. It is hoped that the Borman Study will result in more specific recommendations which address not only the Borman's (I-80/I-94) congestion but also the related problem of funding the under-utilized Skyway (Interstate 90).

September 17, 1990

Congressman Peter J. Visclosky
215 W. 35th Avenue
Gary, Indiana 46401

Dear Congressman Visclosky,

On behalf of the Town of Highland, the following comments are offered for consideration in the preparation of the upcoming Transportation Bill:

1. The Town of Highland is not supportive of the concept of the consolidation of the various types of funding sources if this means the increase in local matching share of these projects.

2. Safety projects funded 90% with Federal Aid H.E.S. Funds have been proven to be extremely cost beneficial, saving many, many lives and untold suffering from both emotional and financial losses.

3. Traffic signal projects funded 100% with Federal Aid "G" Funds have been used to upgrade inefficient signal systems, providing for decreases in congestion and the use of fuel. Given the current and apparently ongoing problems in the Middle East, we should continue emphasizing projects which will lesson our oil dependency.

4. It is our understanding that consideration is being given to changing the matching ratio on almost all local agency projects on the Federal Aid Urban System from 75-25 to 60-40. It is stated that this action will result in the increase of projects built with Federal Aid Funds because the same amount of funds will be able to be used on more projects. We strongly oppose changing the matching ration to 60-40. It is not a mere increase of 15% to the local agency, but rather a 60% increase. Our problem is not with having enough Federal Aid money. In fact, we do not have enough local money to match the available Federal funds.

September 17, 1990

Any increase in our matching portion will result in a direct decrease in the amount of Federal funds we will be able to use.

5. We would also request the continuation of the Minimum Allocation Funding. This funding source with its flexible requirements has been a significant source of funding for street improvements.

Thank you for the opportunity to provide our input on this matter.

Very truly yours,

Ronald G. Bradley
Public Works Director

RAP:JEG:ic

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

MONDAY, OCTOBER 29, 1990

House of Representatives,
Committee on Public Works and Transportation,
Matteson, IL.

The committee met, pursuant to call, at 9 a.m., in the Oak Room, Matteson Holiday Inn, 500 Holiday Inn Plaza, Matteson, IL, Hon. Glenn M. Anderson (chairman of the committee) presiding.

Present: Representatives Anderson and Sangmeister.

The Chairman. Good morning. The Committee on Public Works and Transportation Hearing on The Future of Our Nation's Infrastructure Needs will come to order.

We will be receiving testimony from an impressive group of witnesses, and I know this is going to be a very productive hearing. I want to thank all of you for taking time from your busy schedules to share with us your concerns, knowledge and perspectives about this important subject.

And I regret that we had to cancel the earlier October 6 hearing because of an emergency session of the Congress. So it is a great pleasure to at last be here in Illinois and to talk with the people of the Chicago area. And I want to thank my Committee colleagues, George Sangmeister and Gus Savage, who may be here later, and Bill Lipinski, who may be here later, for making this hearing possible. Special thanks should go to George Sangmeister and the people of the Fourth District of Illinois for welcoming us here today.

And I must compliment the citizens of this region for sending three such hard-working Members to Congress. And, I'll skip to George since two of them are not here. But I will say George Sangmeister has over 25 years of public service, having begun his career in Will County, where he served as Magistrate of the circuit court and later as State's Attorney. And he was a member of the Illinois State House of Representatives and a State Senator, where he served as Chairman of the Senate Judiciary Committee and the Senate Executive Committee. These experiences have served him well in the Congress. And as an active freshman Member, George has brought numerous projects and field hearings to his district and has been instrumental in passing significant legislation in the areas of crime and education. George is an effective Member of our Committee and serves on both the Surface Transportation and the Water Resources Subcommittees, where his participation on these important issues is most welcome.

This year, our Committee has been examining many aspects of the infrastructure issue seeking a better understanding about our Nation's public works crisis. It is important that we know what infrastructure needs and problems are being experienced at the local levels. And so, we have been holding a series of hearings at sites around the Nation to talk with you, the people most directly involved.

And let me tell you why we view infrastructure as a national priority. The answer is our economy.

Infrastructure is not just potholes; it is productivity.

Infrastructure is not only concrete; it is also competitiveness.

And recent economic research shows a link between the level of public investment in the Nation's infrastructure and productivity and profitability in the private sector. The United States productivity growth rate over the last 20-plus years has fallen dramatically at the same time that annual growth rate of spending for infrastructure, by all levels of government, has fallen.

Infrastructure may not be an exciting subject, but it is an important one. Public works are the cornerstone of our cities and rural communities, and they touch the lives of every living man, woman and child.

The evidence reflects that our under-investment in public works spending has caught up with us, and we are seeing wide ranging and serious problems.

Sixty percent of our highways and 40 percent of our Nation's bridges are in need of work.

Urban traffic congestion has increased over 50 percent in the last ten years. In our Nation's largest urban areas, 2 billion hours of time are lost annually. If you are delayed 20 minutes each day in rush hour, by the end of a 45-year career, you will have wasted two working years.

By the year 2000, traffic delays caused by inadequate roads will cost us $50 billion in lost wages and wasted gasoline.

No new airport has been built in this country since 1974.

Many of our urban water systems are over 100 years old and lose as much water as they move.

According to the Rebuild America Coalition, in Illinois, five percent of all paved rural highway miles and five percent of urban highways and streets are rated deficient, as well as 20 percent of the state's highway bridges on the federal-aid system and 33 percent of the bridges on the state and local roads.

And it is not just highways and bridges, and it is not just Illinois. It is a national problem of alarming dimensions. And it is time that we do something about it.

As a start, on September 28, the House passed by a voice vote House Concurrent Resolution Number 362, which I introduced and which was cosponsored by 70 of my colleagues. It expresses the sense of the Congress concerning the need for a national policy to rebuild the infrastructure of the United States.

Now, however, we are faced with a budget that increases motor fuel taxes, among other things, as a means of coping with the budget deficit, and unfortunately, limits what the Committee can do on public works policy in general and with the highway and aviation trust funds in particular. Now, many of us on the Committee are concerned at the broad economic impact of the budget agreement and will continue our efforts to free up highway and aviation trust fund monies for projects that can promote economic growth and not just sit idle as part of a numbers game being played with budget figures.

I assure you, this does not reflect a cavalier attitude about the budget deficit. Rather, it expresses our concern about next year's highway reauthorization legislation and a clear recognition that the condition of our infrastructure must be a high priority, regardless of the deficit. The longer we delay facing up to the challenge to rebuild America, the more harm we do to our economy in the long run and the more costly the job will be.

In the meantime, we are continuing our inquiry and we look to you to help us gain further insight into our infrastructure needs. And the question today is, what is the condition of the infrastructure in Illinois, particularly the Chicago metropolitan area. Are your roads, bridges, public buildings, sewers, wastewater treatment plants, water supply facilities and other basic services adequate to meet current and anticipated needs of the area? And if not, what can be done and by whom?

We look forward to today's hearing to answer these and other questions.

And now, I will recognize Mr. Sangmeister for any remarks that he may wish to make.

Mr. SANGMEISTER. Well briefly, I just wanted to thank Chairman Anderson for holding this regional field hearing today in Matteson. I would like to thank all of the witnesses for taking time out of their busy schedules to testify. However, I think it will be much to your advantage to be here today. I am pleased to have many local mayors and village administrators from my Congressional District present, and I am looking forward as well to hear from your testimony.

Infrastructure issues may not always be the most glamorous items on the agenda, but I cannot think of any more pressing concerns that are facing the U.S. Congress, as our Chairman has just indicated. There are many shocking statistics about the state of our nation's infrastructure. In Illinois alone, 28 percent of our bridges are either structurally deficient or functionally obsolete. It is easy to attach substandard labels to these structures, but what this means in real terms is perhaps more crucial.

Shortly, we are going to hear from Linda Lindquist, Village Administrator of Romeoville, Illinois. And Mr. Chairman, to the people of Romeoville, the closing of the 135th Street Bridge is more than a statistic.

A few weeks ago, the 91-year-old bridge was closed by the Metropolitan Water Reclamation District due to missing metal and corrosion. Put simply, the bridge was deemed unsafe for continued use. Yet, this bridge serves as the principal passageway between Romeoville and Lemont. The end result is that emergency vehicles, including fire fighters, police and rescue squads, are having difficulties responding to calls in a timely fashion.

Homeowners and businesses have expressed their concern, too. In particular, the Panduit Corporation, which employs about 218 people, reports that employees are chronically tardy because their commute time is doubled or tripled since the bridge closed. Since most traffic has been shifted to the State Street Bridge, drivers have been reporting up to 35-minute delays just to cross that bridge.

I do not know, and I know I do not have to express to this audience that loss of time means lost productivity and lost money. The situation in Romeoville is just one small example of the impact our deteriorating infrastructure will have on our economic productivity. We are, without a doubt, moving closer to a crisis stage. And we must shift our focus to providing and maintaining quality infrastructure.

We will also hear testimony today from the village of Ford Heights. I visited this community a little over a year ago, and frankly, was stunned by the quality of their water supply. The residents of Ford Heights have had water with unusually high levels of iron oxide and hydrogen sulfide for the past ten years. According to U.S. EPA, these elements do not present a health threat; however, residents are unable to bathe or wash clothes in their water. In the past, different village administrations have determined the solution is either to hook the village up to fluoridated Lake Michigan water or build a water well reservoir and a new pumping station. Before they choose one of these options, they must complete an engineering study to determine which solution will be the most cost-effective and best serve the long interests of the village.

Due to budgetary restraints, this community cannot afford the engineering study, and I believe it is unconscionable that Ford Heights residents essentially do not have a usable water supply and am working to change that situation there. And I am happy to announce this morning to the community that the $30,000 that was requested for an engineering survey to start the work in Ford Heights has been passed and has been sent to the President, so you can expect those kind of funds to begin the process in Ford Heights.

The two communities that I just referenced are just a small sampling, and they are not to say anything lesser for those who are testifying here this morning. I am pleased that the Committee has chosen to hear from the 4th Congressional District and many other communities throughout the nation before it crafts a major five-year reauthorization bill. It makes sense to hear from our local communities and assess their needs so our federal dollars can be spent efficiently. And Chairman Anderson has continually stressed his commitment to rebuilding our nation's infrastructure, and I wholly support him in this effort.

The United States ranks 55th in the world in capital investment in infrastructure as a percentage of the GNP. Yet, $17 billion stands waiting in that highway trust fund. Another $7 billion rests in the aviation trust fund. As the late Senator Dirksen once said, "A billion here, a billion there and pretty soon, you are talking about real money." So let us start planning for our future by using the money in these trust funds to help communities like Romeoville, Ford Heights, Joliet and others.

Mr. Chairman, at this point, I would like to ask unanimous consent that written testimony from the following communities be entered into the official record: The city of Aurora, the village of

Channahon, the village of Glenwood, the village of Homewood, the Joliet/Will County Center for Economic Development, the village of Mokena, the village of Montgomery, the village of Suak Village and the village of Woodridge.

The CHAIRMAN. No objection, so ordered.

[The letters referred to by Mr. Sangmeister appear on pp. 2163-84.]

Mr. SANGMEISTER. All right. And I suggest, Mr. Chairman, we proceed with the witnesses in whatever order the Chair would like to go.

The CHAIRMAN. Because of the number of people willing to participate in this hearing and because of the time constraints, I am going to ask each witness to summarize their statement orally in three to five minutes. But each person's full statement will be printed in its entirety in the record of the hearing.

Now, I want to call our first panel of witnesses from Congressman Sangmeister's district. We have Mr. Sterling Frazier, Village Administrator, speaking on behalf of Mayor Gloria Bryant of the Village of Ford Heights; Mr. Gordon McCluskey, City Administrator, Lockport; the Honorable Charles Connor, Mayor of Joliet; Mr. Ned Becker, Transportation Director, Naperville; the Honorable Dennis Valy, Mayor of New Lenox; and Ms. Linda Lindquist, Village Administrator of the Village of Romeoville. I want to welcome you all, and we look forward to hearing from you. And you can choose the time you want or you can follow the way I suggested. The first one I have on here was Sterling Frazier, but I will let you people organize it.

TESTIMONY OF STERLING FRAZIER, VILLAGE ADMINISTRATOR, VILLAGE OF FORD HEIGHTS; GORDON McCLUSKEY, CITY ADMINISTRATOR, LOCKPORT; HON. CHARLES P. CONNOR, MAYOR, JOLIET; NED P. BECKER, TRANSPORTATION DIRECTOR, NAPERVILLE; HON. DENNIS VALY, MAYOR, VILLAGE OF NEW LENOX; AND LINDA LINDQUIST, ADMINISTRATOR, VILLAGE OF ROMEOVILLE

Mr. FRAZIER. Thank you, Mr. Chairman. Mr. Chairman, distinguished members of the panel, I take this opportunity to express my gratitude to you and especially to our own representative, Congressman George Sangmeister, for holding this fact-finding hearing in our area and for giving me the opportunity to present testimony today. My name is Sterling Frazier. I am a Special Assistant to the Mayor of the Village of Ford Heights, Illinois.

The problem I wish to address this morning was already spoken of by Congressman Sangmeister, and that is the problem of potable water in the Village of Ford Heights. This problem has served not only to distress our citizens, but has been singular in impeding economic growth in our community.

Perhaps the best way to begin is to provide you with a brief history of the Village of Ford Heights and establish the context for the problem I will be discussing.

Ford Heights was incorporated as the Village of East Chicago Heights, Illinois immediately following World War II. The original settlers were soldiers returning from the War and Chicagoans seeking an alternative to urban living. The social structure consisted of urban middle class, factory workers and migrants from the rural South.

Over the past two decades, we have witnesses a steady erosion of our middle class residents. As our children become better educated and seek to fulfill their career goals, they leave home and due to expanded housing opportunities and the absence of available housing in Ford Heights, they tend not to return.

The net result is that ours has become increasingly a community of low income families and senior citizens. The 1980 Census showed a per capita annual income for Ford Heights to be less than $5,000, making us the poorest urban community in the United States. The erosion of our middle class produced a corollary devaluation of our basic assets and a shrinking revenue stream in the face of rising operating costs.

One important and dependable source of revenue over the years has been our water. Because our water system consisted of five wells which produced an abundance of water, the Village had been able to sell water to neighboring industries and communities. Both the City of Chicago Heights and the neighboring Ford Motor Company Stamping Plant were important customers for water and provided much of the revenue needed for essential public services to our citizens.

In 1986, Chicago Heights began purchasing Lake Michigan water. And in 1987, the Ford Stamping Plant annexed to Chicago Heights. Their stated reason for annexation to Chicago Heights was that the quality of water purchased from Ford Heights caused sufficient damage to their equipment and machinery that maintenance and repair costs became unacceptable.

I recently talked with a cosmetic manufacturer who was looking for a south suburban location for a new factory. In frank terms, he advised me that Ford Heights could not be considered as a possible site due to our water quality. There are many similar stories I could bring you, all of which have the same ending.

Technically, our water is safe. Both EPA and private laboratory results show that our water meets the minimum standards for potable water.

The practical fact, however, is that our water is of limited use to our citizens and of no value to commerce or industry. Our water has a reddish brown color due to the high iron content and has an offensive odor caused by high hydrogen sulfide levels, both of which are below minimum limits for drinking water as established by EPA.

We find ourselves caught in a chemical aberration where our water quality meets accepted EPA standards, but is offensive to human senses and unfit for industrial use.

I have submitted to you for the record a recent report from Mr. James W. Wilner, Chief Engineer for American Water Works Service Company, Inc. They are the nation's largest operators and owners of well systems. Mr. Wilner inspected our water system and reviewed EPA and private laboratory analysis for the past 12 months. His conclusion was the same. Our water meets minimally acceptable standards, but is of no practical use.

The solution to our dilemma can only be developed by a comprehensive study that will better define the problem and weigh the feasibility and cost effectiveness of the various alternatives. Our engineers estimate that a study of our water system would cost $30,000. This brings us back to the problem of inadequate revenues to provide basic public services. While the cost of this study may seem paltry to the average municipality, it represents half the annual payroll for our Public Works Department. The trade-off is unworkable.

In the meantime, our competitive edge afforded by our land and transportation assets are neutralized by the intractable problem of our water quality.

I come to you with this problem seeking a solution. Moreover, I seek a solution that can be implemented immediately. The industrial and commercial opportunities already lost cannot be recovered. And we know that without immediate action, the chance for capturing industry will continue to decline.

I thank you for your attention. I make myself available for your questions and recommendations.

And let me take this opportunity to express our appreciation to Congressman Sangmeister for the work he has already done in getting a solution to this problem. I cannot tell you what it means to us that you have made the kind of progress you have in getting us the funds to do the study. We are certainly appreciative of that. Thank you.

The CHAIRMAN. Thank you. We will hold our questions until we hear from everybody.

Our second witness is Mr. McCluskey. Gordon McCluskey.

[The prepared statement of Mr. Frazier appears on p. 2084.]

Mr. MCCLUSKEY. Thank you. The City of Lockport would like to extend our appreciation to you, Mr. Chairman and Mr. Sangmeister, for this opportunity for offering both oral and written testimony.

The Lockport City Council has requested the following infrastructure needs of our community and/or the area be provided. I would indicate that I am the City Administrator for the City of Lockport. I have been with the City of Lockport for 22 years. I am a registered professional engineer in the State of Illinois.

The Exhibit A, which was attached to the correspondence, is supported by the City Council action as of October 1, and it is the Will County transportation needs in an unprioritized order.

Exhibit B is the City of Lockport's transportation short- and long-term goals. In particular, one of our transportation long-term goals, the high-level bridge at Bruce/Caton Farm Road is now a top priority. With the recent unannounced closing of the 135th Street Bridge, Romeo Road, which Mr. Sangmeister had referenced to, and the prior closing of our division street bridge, all traffic is rerouted through Lockport. At peak times, east of 9th Street high-level bridge, we have gridlock on Route 7 east to Lincoln Street, which is about a mile and on Route 53 north to Lewis University, which is about a mile. We need another high-level bridge.

We feel the location at Bruce/Caton Farm for the next high-level bridge offers a greater area wide benefit in that it would connect the south leg of 355 when it is built, which is Lake Will tollway, to

Illinois Route 171, 53, 30, 55, 59, westerly to 47 and 71 to become a local east-west interconnect lying between I-80 and I-88.

Both of these exhibits confirm our need for continual federal support and continued funding through the Highway Act and funding for the local Joliet Urbanized Area Council of Mayors. I would indicate outside of the context that the five cent tax that you are talking about is just unfortunate that all that money cannot come back to the local people for distribution to satisfy our local needs.

Exhibit C, which was attached, is further correspondence to the Illinois representatives which illustrate the need for infrastructure, including storm sewers, sanitary sewer improvements, emergency alert sirens, public works equipment and local health problems. Two of these items are highlighted by the recent Plainfield/Joliet tornado and the lack of notice and also the very wet summer, which produced a bumper crop of mosquitoes. It is hard to realize mosquitoes, when it is as cold as it is now, but gentlemen, they were a problem this summer. It is my understanding that had the Doppler radar been available, instead of Marseilles, but at the Lewis University Airport, which is a project that is on the books by the Joliet Port Authority, we might have had a proper notice through the proper type of radar.

We would like the designation of the federal disaster area to include or initiate further action of the moving of the weather station from Marseilles to Lewis University. We have also cited within the presentation the historic downtown improvements and revitalizations that are being made. The I&M Canal Heritage Corridor and the Canal itself is in need of improvements. The Heritage Corridor, despite that designation, is the main storm sewer collector for the City of Lockport, and it does need work.

Enterprise zone opportunities are offered with tax abatements that are not spread over the existing population, and we do need help with that.

Regrettably, time does not allow further comments at this time. The City Council and our citizens thank the Chairman, the Committee and you, George, for this opportunity to make our public statement. Thank you.

The CHAIRMAN. I believe next is Mayor Charles Connor.

[The submission of Mr. McCluskey appears on p. 2133.]

Mayor CONNOR. That's correct, Mr. Chairman. Thank you, Mr. Chairman, and thank you, Congressman Sangmeister. My comments have been filed. I did not hear it picked up earlier.

Mr. SANGMEISTER. Those that I put on record were those of communities that were not here.

Mayor CONNOR. Oh, excuse me.

Mr. SANGMEISTER. Yours will all automatically be in the record.

Mayor CONNOR. Okay, fine. I just wanted to make some oral comments on that testimony. I am not an expert in these matters, but I just would like to concentrate on the problems of older cities like Joliet. Joliet is a city of about 80,000. It is about 160 years old, settled shortly after 1830. We had steel mills in Joliet in 1869, we were kind of a typical rust belt area milltown. We are coming back. We have had some problems.

The cold figures in these comments are bad enough, but I think things can get even worse in some ways. The cold figures show that for a new water source, for better wastewater treatment, for bridges, for roads, that our bill would be between $150 and $200 million. Now that is for the city, where seven years ago, we had the highest unemployment in the United States, about 26½ percent, and where the unemployment, as I understand it, is still in the area of 11 percent.

Now you get an older city like Joliet that has a lot of the urban problems of America, even though we are only a city of 80,000. You know, we have gangs, we have drugs. We have a certain amount of blight. We have a substantial population—a black population, Hispanic population. And those create—you know, those problems give people reason to leave an older city. You know, a person can move five miles from downtown Joliet, you can have a septic system, a well, a volunteer fire department and a school with very few minorities in it. And that is a pull that drags people out of cities like Joliet. And we do not need any more reason, like high taxes, to help repair our infrastructure, to convince people to leave.

The $50 million approximately it will take us to find a new water source on the Kankakee River has already caused us to raise our water rates 48 percent. We met the problem head on, and we have increased our water rates by about 50 percent. And those are the kind of things that make people want to leave a city. So you know, I am just telling you that we do need help. I do not know how you would fashion that help, but it is very difficult for the older cities to meet some of these problems.

And a particular problem, you know, I make reference to is the problem of going down to the Kankakee River and get that water. That is going to cost us $50 million. And we have a river and a waterway that goes through the center of Joliet that should be an asset to the community and we are trying to make it an asset to the community. It even could supply us with some water, but because of failure of infrastructure upstream, we have a dead waterway. It cannot be used for—it cannot be used for water, it cannot be used for recreation. And I have lived in Joliet 61 years. I have never seen a fish come out of it, it is a dead stream. We cannot even get water out of it. So not only do we need it. Some of the places like the Metropolitan Reclamation District need it so we can fish off our Jefferson Street Bridge.

So, in summation, I would just like to say that older urban cities need help with their infrastructure. Like I said, there is a lot of reasons to leave. I would like more reasons for people to stay. And I wish I could give you some specifics on the solution, outside of money. Thank you.

The **Chairman**. Thank you very much, Mayor.

Ned Becker.

[The prepared statement of Mayor Connor appears on p. 2081.]

Mr. **Becker**. Mr. Chairman, Congressman Sangmeister. Thank you for the opportunity. I am Transportation Director for the City of Naperville. I have been there for 20 years. And I am also a registered professional engineer.

The thrust of my comments this morning are based on transportation and solid waste. Regarding transportation, I think there are two distinct challenges facing us today.

The first is to develop programs that will assure that our very intense investment in transportation facilities is maintained. Taxpayers have invested literally multi-billions of dollars in building a system that is unequaled in the world. Unfortunately, the cost of maintaining these facilities in the long run usually costs more than the initial investment.

I suggest a greater emphasis needs to be placed on the maintenance efforts in order to guarantee retention of the facilities that we have. The focus of that attention needs to begin at the highest level, at the Congress. I would also suggest that any further investment in new facilities should be dependent on a commitment from the responsible agency for maintaining the existing systems.

I also think that before we simply embark on a program to replace those elements that exist today, that a requirement be made that alternatives be reviewed in order to determine whether or not the existing improvements are the most appropriate. We have learned much since the initial construction of these elements of the infrastructure. There are, in many cases, more cost-effective solutions.

The second challenge facing us today is to determine how best to invest dollars into the transportation system of the future. I realize that may not be the specific objective of this hearing, but I would like to at least offer comments relative to that future investment.

I suggest that much more attention needs to be directed at more effective incident management. Incidents are defined as anything from accidents to utility repairs. It has been shown through documented federal studies that half of the congestion that exists today is the result of incidents, as opposed to capacity restraints. What this is going to require is more awareness on the part of those individuals responsible with maintaining and developing the transportation infrastructure. It will be necessary to everyone who has a role in the transportation system will have to be aware of the problem of incidents and work together to reduce that figure. Obviously, we are nowhere near effectively utilizing the system that is already in place.

In regard to the matter of solid waste, which by the way, we in Naperville prefer to call resource recovery, I do not feel there should be an emphasis on worrying how we are going to replace existing facilities, such as landfills and incinerators. Instead, I think our efforts should be directed toward finding ways to reduce, renew and recycle our resources so that we do not have a need to try to burn up or cover up these needed resources. I am convinced that in regard to the issue of resource recovery, we all know what we have to do. It is a matter of making a commitment to do it. I see the need for a federal focus in the areas of education and encouragement to do the right thing. The actual delivery of the service then could be maintained at the local level.

Thank you again for the opportunity for presenting these remarks.

The CHAIRMAN. Thank you.

Mayor Dennis Valy.

[The prepared statement of Mr. Becker appears on p. 2079.]

Mayor VALY. Yes. Thank you, Mr. Chairman and Congressman Sangmeister. I am Dennis Valy, Mayor of New Lenox, a town of 10,000, located 35 miles southwest of downtown Chicago.

More than 260 municipalities outside of Chicago in northeastern Illinois participate in transportation planning through eleven councils of mayors. I am Chairman of the Executive Committee of these councils. I am testifying on their behalf today.

The Executive Committee and the Council spent a considerable amount of time and energy over the past two years identifying our infrastructure needs and working toward a strategy for meeting these needs. We have come to the conclusion that a crisis is in the making and have formulated ideas on how to avert this crisis.

First and foremost, the mayors support a substantial role for the Federal Government in urban mobility. We are united in our support for continuation of the Federal Aid Urban Program or a program very similar. This program has done the job it was intended for in our region. The success of regional planning and decision-making and the near total expenditure of these funds on projects to increase mobility between urban communities are evidence of a good program. The reauthorization must include a program which delivers federal money directly to local projects within the metropolitan area. For the local elected officials, the responsibility for selecting and programming the projects funded through this program is of paramount importance since we are the ones most familiar with the need.

The focus of the federal—of future federal programs should be on urban areas to enhance mobility and attack congestion. Urban mobility is a national concern because our nation's economic vitality is dependent on it. Yet, the FHWA has drafted a proposal calling for creation of a rural-based national highway system that would result in less federal funding for urban areas. This proposal, even with supplemental urban programs, oddly fails to meet our needs.

A separate formula driven program is essential for urban areas to allow for continued efforts to implement solutions to intra-urban travel. Programs need to have uniform matching provisions so that no local decision-making is driven by a project's ability to attract the greatest federal participation. The new program must be flexible—flexible in such a way as to meet the very needs of different subregions within the metropolitan area. The ability of the locals to overmatch federal funds is critical. In areas that have this ability, overmatching enables federal dollars to go further. This option should be retained in future programs.

Other areas of flexibility of particular importance to northeastern Illinois is the ability to commingle federal and private funds. Augmenting federal dollars with tolls, development fees and impact assessments allows many more projects to be accomplished with the same federal dollars. Municipalities have worked long and hard to encourage participation by the private sector in building and rebuilding of infrastructure.

The State, last year, was successful in passing a six cent increase in the state gasoline tax. The Federal Government must show an equal willingness to share the load in order to foster a healthy economy. Recent studies included one by Apogee Research, Inc., have illustrated the connection between a solid investment and infrastructure and the country's gross national product.

The American public is being deceived on the matter of user fees for transportation. As you well know, a portion of these funds have been held hostage for deficit reduction for several years. This has been a total deception. User fees are only appropriate when they are used for the purpose for which they are collected. To compound this deception, the budget compromise included a five cent hike in the gasoline tax for deficit reduction. This creates a dangerous precedent that is totally obnoxious to our mayors. All federal motor fuel tax funds should be used for transportation purposes. Was there any attempt on the part of this Committee to assure that funds for our proven transportation needs was part of this package? According to the Apogee study, a sustained $40 billion federal highway program could generate an additional $400 billion in gross national product and $29 million—billion, excuse me—in corporate profits annually by 2012.

The USDOT's own reports show a tremendous need for investment in order to stave off future substantial increases in the cost to rebuild infrastructure. A 1989 report to Congress by USDOT identified 40 percent of the pavement on the federal system as in poor or fair condition and 28 percent of the bridges as structurally deficient or functionally obsolete. Conditions in northeastern Illinois parallel national needs. The DOT said a 20-year $40 billion annual investment would be necessary to meet existing highway capital needs. That would be $25 billion above the current annual federal highway spending. Federal funds must be part of the mix that rebuilds our transportation system.

To sum up our recommendations on rebuilding our ground transportation infrastructure, we need a program that is flexible, formula driven and retains the ability of the local elected officials to select and program projects. In addition, the funding for the Federal Aid Urban or a similar program must be increased. The federal funding for this program stayed the same for over a decade, even after the federal motor fuel tax increase in 1983. In this last act, the funding for the FAU program decreased.

Finally, let me turn my attention to airports. The Council of Mayors have been an active participant in the ongoing consideration of a supplemental airport for our region. As you are aware, Illinois and Indiana are currently undertaking a study to determine the location of a supplemental airport for our region. We need sufficient airport capacity to keep up with rising demand. It is in the economic interest of our area to do so. From a national perspective, additional commercial airport capacity is needed, especially in a strategic area such as the Chicago region. A bi-state study concluded that additional airport capacity will be needed in the near future. The Federal Government should be a major source of financing for development of this additional capacity.

This concludes my testimony. As you continue to work on balancing demands for increased transportation funding with the very real need of reducing the deficit, please remember the link between investment in our national—nation's infrastructure to our national prosperity.

Thank you again for allowing me the opportunity to present the concerns and ideas of the Council of Mayors.

The CHAIRMAN. Thank you, Mayor.

Ms. Linda Lindquist, Village Administrator of the Village of Romeoville.

[The prepared statement of Mayor Valy appears on p. 2126.]

Ms. LINDQUIST. Chairman Anderson and Congressman Sangmeister, on behalf of the community of Romeoville, I want to thank you for the opportunity to speak to you today, not only on an issue of future planning and infrastructure needs of the communities at large, but also an immediate crisis that Romeoville is experiencing.

Just a moment to take some brief history of the community. Romeoville is not your typical suburban bedroom community. We are a village of approximately 16,000 people, mostly blue collar people. Homes were built in the post-war period of $100 down and $100 a month mortgages. We reflect a mixed heritage of our people. We have a combination of Yankee stubbornness and to take care of our own and Southern gentility that defines what is our own very broadly. This is fairly common, but we have done some unusual things that set us apart.

Romeoville sits in the heart of some of the most prime industrial development land in the state. Growth projections for our area provided by the Illinois Department of Transportation and the Northeastern Illinois Planning Commission astound us. With our available land, utilities and transportation facilities, we are in the center of an area that is attracting major players in the nation's corporate and industrial development.

We did not get into this position by accident. A few years ago, we looked at what could be done to spur economic growth in what was a stagnant community. This growth was vital to generate revenues needed to support existing infrastructure needs through the development of new revenue sources. Among other items, our staff determined that we needed an interchange off the I-55 Interstate at Weber Road. After a coordinated effort by the village officials and staff, the State Highway Department, the county and developers interested in the area, we knew we had a good idea. The state planned an interchange in the area within the next ten years, but we needed it now. The state agreed to move the funding up for the interchange if local funding was found to match half of the estimated cost. To the surprise of many, we did it. Two developers each contributed $1.5 million. Romeoville literally sold a farm we had to pay our portion. Will County and the Will County Center for Economic Development worked together to find FAU funding to make up the balance. As a result, approximately 24 months later, last week, the Romeoville Interchange opened.

In a self-congratulatory burst of exuberance, we felt as if we had worked a miracle. Coordinating these efforts was a hard arduous process, but it was done. Our experience with miracles is limited, and we are finding the supply is not endless.

Over the past 89 years, we struggled with the normal infrastructure demands that most communities face. We have also had to deal with repair and replacement of decaying infrastructure. Through long-range planning, capital improvement financing and creative use of time and energy, we have been almost able to hold our head above water. New revenues generated by growth are funneled right back into capital needs programs. The two-year temporary income tax surcharge enacted by the state has allowed us to resurface over 29 streets in our community, some of which had deteriorated to gravel roads. This would not have been possible without the assistance of the state. But this is not my main topic. I just wanted to illustrate that Romeoville has a history of doing the work behind the project and the problem.

Why I am here today is to tell you that Romeoville lies in the northern portion of Will County. The Chicago Sanitary and Shipping Canal and the DuPage River cut through the eastern third of our community. It is this portion of the community that houses approximately 40 homes and four businesses. This area also represents one-half of the village's assessed valuation. It is considered to be a primary entrance into the Will County growth corridor. In the past month, this area has become of critical concern to Romeoville and the surrounding communities.

In September, we were notified with no warning that the Metropolitan Water Reclamation District of Greater Chicago had closed the 90-year-old bridge that connects the eastern and western portions of our community. This caused village officials to scramble to ensure that there was no loss of safety-related services to the area. This was not easily done. The nearest alternate routes to the area add 20–30 minutes to our response time. When you are dealing with police and fire calls, this is not acceptable. Temporary agreements with other agencies were hastily struck. I do not know if either of you have ever been through a refinery fire. We have. Critical response time is primary to us.

Although the Metropolitan Water District of Greater Chicago was certainly aware that at 90 years, the bridge had outlived its estimated life span of 50 years, this was the first time this summer that extensive testing had been done to determine how sound the bridge was. As Congressman Sangmeister said earlier, it was found unsafe for vehicular traffic after finding that as much as 50 percent of the infrastructure had decayed due to rusting and corrosion.

The District has no plans to renovate a bridge of this age, and that is understandable. They are not in the bridge business, and providing a new structure, if there will be one, will up to Romeoville to spearhead. Replacing this bridge is not something we can do alone. In this situation, there are several agencies involved. It appears that after digging through old documents, court orders of decades that the bridge may, indeed, belong to Romeoville.

Replacement of this type of infrastructure is difficult enough when authority or responsibility is clearly defined. In cases such as this, it has become a frustrating and time-consuming experience. Romeoville is committed to being involved, but we feel no effort by a single agency can overcome the scale of reinvestment or cut across jurisdictional barriers. Had we been notified of the life expectancy of the bridge earlier, we could have become involved before this situation reached a crisis.

This 90-year-old structure provided transportation access to nearly 6,000 vehicles a day. That was at a reduced weight limit. Projections for the year 2000 are 18,000 vehicles a day. Loss of this vital transportation link will have an immediate devastating effect on the economic growth of our community. Already one business has closed its door and two more anticipate closing within the month.

The Weber Road Interchange I mentioned earlier was built to accommodate an immediate need of 3,000 vehicles per day, so you can see the relationship with how important this bridge is to our community. Without this bridge, all of the traffic is being diverted over the only two alternate routes available. Both of these are also bridges. Traffic delays of one hour are becoming common. As was mentioned, our local businesses are having problems getting their employees to work. Traffic accidents have begun to increase. There are three railroad lines intersecting the highways in this area. And our response to railroad and refinery accidents is of primary concern to us.

Closure of this bridge has impacted the economic development of the entire northern portion of the county. If the village had the bonding capacity and a way to pay the debt, we would build the bridge ourselves. We cannot issue the bond sufficient to pay this debt. Surrounding municipalities dealing with increased traffic patterns as a result of this closure agree with the need of replacement, but none have an open wallet either.

The Metropolitan Water Reclamation District has an elected board, but the constituents do not live in Will County. Where are we going to go to for help? What are we going to tell the 6,000 users of that bridge?

I am sure you will find similar situations all across our country. Infrastructure replacement is not something that is new. It has been put on the back burner far too long. These big ticket projects usually cost more money than most communities ever hope to raise locally. The property taxes already represent an increasing burden and are not available for a non-home rule community in a situation such as ours.

The burden of replacing what we already enjoy is ours, but we need assistance. It is critical that a plan be developed and enacted to provide relief to communities like Romeoville—excuse me—struggling at the grass roots level to provide day-to-day services that your constituents and ours have come to enjoy. Thank you.

[The prepared statement of Ms. Lindquist appears on p. 2110.]

The CHAIRMAN. Thank you, Ms. Lindquist.

Thank you. Your statements have been most interesting, and I do have a couple of comments, a couple of questions.

Ms. Lindquist, next year, our Committee will be writing a new highway bill. And at that time, I would certainly want to work with you and George to help secure federal funding for the 135th Street Bridge that you mentioned.

And Mr. McCluskey, let me just point out that Congressman Sangmeister was very successful this year in securing three million dollars for the I-80 Interchange that you referred to. And I can tell you, getting these funds was not easy, so I hope you appreciate all of George's efforts back in Washington on your behalf.

And if our Committee develops a general infrastructure bill, the funds of which would be distributed to communities around the country in part on the basis of benefit cost analysis, how do you think your project would fare in relation to those that we get suggested from elsewhere? Do you want to comment on that? And I might just kind of start by saying, looking at infrastructure problems, what steps are you taking or can you take to meet your particular needs, and what kind of help do you expect from the state and the Federal Government?

Mayor **CONNOR**. Well, I will just take a crack at that. As I mentioned, the City of Joliet, in order to meet a federally and state mandated change of water source because of high radium, we increased our water bills by almost 50 percent—48 percent, specifically. So, you know, we do attempt to meet these problems head on. I do not know what criteria you would use in prioritizing—I do not like that word—prioritizing who gets what. But, you know, if you used—if you used some measure of what a community can produce, I would think Joliet would do pretty well. We have high unemployment. We have substantial people—number of people below the poverty line. You know, and we have made efforts on our own to do things. Now, I do not know, Mr. Chairman, what other criteria you would use. But, on the ones that seem most logical to me, I think we would do pretty good.

Mr. **MCCLUSKEY**. I would support that position. I would think that any one of projects—be it 431, the south leg, the tollway, the high-level bridges, the storm sewer needs that we have, the Dopler radar that I referred to—I have no question in my mind—no doubt in my mind as to your question that we would rank high on any priority list you would have.

Mr. **FRAZIER**. I would just like to say, Mr. Chairman, that since nobody wants to take first place, Ford Heights would be more than glad to accept that position. I think if we are going to compare negative numbers in terms of high unemployment and per capita income—if we are going to base the criteria on need, I do not think anyone could surpass our need. I think the urgency in terms of the rapid development of our section of the county requires us to move rather fast on this, and I would assume that whatever priority that you are going to develop would have—would be somehow related to immediate impact. And I think that Ford Heights would rank very high among those.

Ms. **LINDQUIST**. I would like to suggest too, Mr. Chairman, that as we prioritize these needs, while the impact of the individual communities is very important, it needs to be looked at as the impact to the entire surrounding community. An overseeing body, such as a county, that can help make recommendations and prioritize within their general overseeing area. Their input is very important. Each community should not be placed in the position of vying with their neighbor for federal funding. We should look at the overall impact to that general area.

Mayor **VALY**. Mr. Chairman, the Will County Center for Economic Development has a Transportation Committee, which I also chair, and we have sent out surveys to all the municipalities within the county asking them to send us back their regional needs—not just local needs. And to that, we have prepared a list of regional projects for the county, and we just have included the 135th Street Bridge on that regional list, so I—in answering your question, I would think Will County stands ready to look at the regional needs on a much larger, broader scope than local needs, and I think that is what Linda was referring to.

Mr. BECKER. Mr. Chairman, comment—what I tried to do was to focus on the fact that I think a lot of times, we get wrapped up in having to do new things or replace existing. And really, I would think it was important to try to include something in the legislation that would at least require before the projects are even funded—require a commitment on the part of the local agencies to take a look at, are they maintaining those facilities in a way that will assure that investment in that facility into the future. And then, there is a lot of ways, as we deal on a day-to-day basis with problems of trying to wring more capacity out of the existing facilities. There are things we can do, and I think that Administrator Larson has pointed out previously about this incident problem. The fact that there is so much delay as a result of accidents, as a result of utility cuts and things of that nature that are causing restraints in our system that are not—we do not have to do something in those areas to build something more. We just have to manage the facilities that we have today. So again, in that area, I think we would like to see something that would force that. Then, the determination of priority on the new projects; in effect, are we spending the money in the most wise manner? Thank you.

The CHAIRMAN. As officials of the communities close to or within Metropolitan Chicago and fairly close to the state line of Indiana, some of you may have some problems in common with them. How do you think these mutual problems, and do you think that our Committee should be looking into a regional approach to help solve regional problems involving large metropolitan areas, or do you think it should be those that cross, perhaps, for example, state lines?

Mayor VALY. Well, the Council of Mayors in the six-county region are already in place for all the transportation needs. We represent 260 municipalities, and we certainly have been in place for almost 20 years.

The CHAIRMAN. Are they all in Illinois, or do they cross lines?

Mayor VALY. All in Illinois. But, we do work very closely with Indiana for transportation needs because we are well aware of the fact that they do intertwine. We work closely with their planning and their transportation divisions to make the whole system work. So that is already in place here in northeastern Illinois.

The CHAIRMAN. We had a hearing a few weeks ago in Indiana, and we found that there were some people who wanted to get transportation to Chicago from Indiana better. We equally found there are some officials from Chicago that came over and wanted to get into certain places in Indiana, so——

Mayor VALY. Well, there is a joint effort right now with Indiana and Illinois for the Borman Expressway, for instance. I think that might be one of the things you are talking about.

The CHAIRMAN. That was one of the names that came up.

Mayor VALY. And there is also a highway that has been on the books for over 20 years for a new east-west freeway—which I do not think it will be a freeway, but it is called a freeway now—to link, say, I-55 all the way to I-65. And that will take the pressure off the metropolitan area. And that is—Indiana has been pushing that even harder than Illinois, but Illinois is getting on board right now. So, we are working in joint across state boundaries and regionally in that effort, and that is why we are so concerned about the Federal Aid Urban Program continuing because that is the program that originally got the mayors together. But, we go much further than just the federal aid program in our conversations. And quite frankly, when local officials get together and talk together, everything works better.

Mayor CONNOR. Mr. Chairman, I just might have one word. There are areas that have gotten together to solve problems. I think most of the communities in Will County in my area have a problem with water. DuPage County just north of Will County, almost the whole county has gone to Lake Michigan water. Whether that is possible financially for Will County to do, I do not know.

But, I did want to mention that at some sacrifice to the people who live in the Des Plaines Valley, about 90 years ago, the Chicago River was turned down—turned around, and we take all of the sanitary waste from the Greater Chicago Area right through the middle of Joliet. In the 1880s and 1890s, Chicago had water borne disease rates like Calcutta, India. Talking to someone from the—I still refer to it as a sanitary district—I think one year in the 1880s, 80,000 people died in Chicago. So at some sacrifice to our recreational and aesthetic values, we have contributed to keeping Lake Michigan clean, and maybe—excuse me—some kind of federal project to get us water out of Lake Michigan would not hurt anything.

The CHAIRMAN. Thank you. Mr. Sangmeister, do you have any questions?

Mr. SANGMEISTER. Yes. Sterling, now that you know that you have got the $30,000 for the engineering study for that water problem you got out there, and obviously, the reason for those funds is so that you can have an engineering study and come up with costs on what you are going to do. But for me, have you got any idea—have your present engineers given you any ball park figure as to what it is going to cost? Or, do you even know at this point? Can you use any of the existing system at all, or is it going to be entirely scrapped, or can we use that and go for another well? Or, just what—what is your engineer talking about? He must be talking somewhere in the ball park?

Mr. FRAZIER. Yes, Congressman. We have done some work in the anticipation that we would solve this immediate problem of funding the study. It appears that the mains—the infrastructure is in pretty decent shape. Our wells are in pretty decent shape in and of themselves. What we are looking at, then, is adding a filtration capability, which is expected to cost somewhere about anywhere from $750,000 to a million dollars. We have also learned a great deal from looking at some of our neighboring communities who also have well systems, and the cost of installing and operating filtration systems in those communities have been very valuable information for us in terms of where we are going to go in the future.

Mr. SANGMEISTER. Okay, then. That at least gives us a ball park that we are working within, and you will—this engineering study, I am sure, will come up then, obviously, with the final costs and what has to be done.

Mr. **Frazier**. That is correct. In addition to that, the community is eligible for CDBG funds.

Mr. **Sangmeister**. That was my next question. What local funds do you see that can be also put towards this project?

Mr. **Frazier**. Well, the Village Council has already taken the position that a substantial portion of its CDBG allocation for 1991 will be applied to the solution of this problem. That is expected to approach about half of the cost. The other half of the cost—roughly about a half million dollars, we estimate—we are not quite sure where it is going to come from. We are going to be looking around for other sources. I think the study itself is going to be one of the principal tools for identifying potential sources for funds.

Mr. **Sangmeister**. Well, as we know, from being out there, your community needs a lot of things. But, I think this is, without question, the number one priority. When I saw the water coming out of the spigots in homes out there that, you know, frankly, I would not bathe in, let alone use for drinking water. I know from EPA that it is safe drinking water, but the smell and the looks of that water are something I do think has to be done out there.

Mr. **Frazier**. Yeah, and we are very glad you came out and saw it for yourself. Most people do not believe the conditions when we describe them. And it is also hard to describe those conditions and then say at the same time, "But the water is safe." It is a real——

Mr. **Sangmeister**. Gordy, I do not know if you are aware of it or not, but on that Dopler radar that we are all concerned about getting installed because of the tornado that we had, there is a better unit. It is called a Nexrad. I do not know whether you have heard about it or not. That is about a $2½ million unit. The National Weather Service is looking for about 160 of those. And, Lewis University is designated and it will get one. Now we are number 16 out of 160. We are trying to move up on that priority list. What that means is by 1992, Lewis University will have it. We are trying to move it up to next year if we can. So far, we have not been successful in getting that done, but we have not given up on that. That is a super sophisticated piece of equipment that truly will be able to track tornadoes.

As you know, the one that went through there, when you hear from the National Weather Service, was not even sure that the Dopler that they presently would have, obviously, does not even pick it up. But, this unit would, so I think that is on the horizon, and we will be working for that.

Outside of that, on behalf of—you know, the Chairman must talk in very general terms because he has got the whole United States to be concerned about. I have you people and many more in this district to be concerned about. So, I know, as I discussed with you a few minutes before the hearing started, you have got a water problem up in Lockport, as Joliet does and as Plainfield does. But you are getting some relief and some changes in EPA regulations. Do you think that is going to pacify it for a few years or—about that specific project, what would you—give me some info.

Mr. **McCluskey**. I think what is going to happen with the change in the limit of the peco curies, it takes the immediate need off. As I indicated, we—the City of Lockport—are under the pollution control board orders—many municipalities are. That is a band-aid approach. I think what ultimately has to happen as the area grows and we all had reference to the interstate system and the potential growth of the area through the Interchange that you need water and you need sewerage, and both of those do not come without a cost. It is going to take us out of the pollution control board order because we would lie within the limits. However, there is still a need for a more dependable source of water, other than deep wells.

Mr. SANGMEISTER. So, you are looking some place as well, right?

Mr. MCCLUSKEY. That is correct.

Mr. SANGMEISTER. You are looking at Lake Michigan as well?

Mr. MCCLUSKEY. That is correct.

Mr. SANGMEISTER. Okay.

Mayor Connor, you talking about $130 million would not hurt your community at all.

Mayor CONNOR. I am not looking for the check, George, but it would help.

Mr. SANGMEISTER. Okay. It is not in the mail either. But in looking through your written testimony and your oral testimony, you are talking about everything from bridges to storm sewers and your water supply and that. Give me a project that—it is hard to prioritize when you need everything. Okay? I know the city needs a lot. But, if you were to pick out the thing that is most important for the city you represent, which project would you put the priority on?

Mayor CONNOR. Well——

Mr. SANGMEISTER. I know it is very difficult, but——

Mayor CONNOR. It is very difficult. You know, I might not go to any of the projects that were listed here. See, I do not know how the Federal Government looks at toll roads. You know, I think one of the answers to Joliet's continued growth—and I think we have grown. I am not going to make any comments on the Census Bureau. That is probably another discussion. But they did not count Joliet. Anyway, you know, I think immediately in terms, you know, of our water problem because that is a big number. I would think in the long run, I think we will be able to solve that problem.

I would like to see the north-south tollway go through. Now I do not know if that is an infrastructure program that the Federal Government would address. It has been my understanding that the Federal Government does not want to get involved in tollway construction. I would think if it is true, and I am sure it is, as people have mentioned here today that the big expenses of highway construction are maintenance, rather than the—you know, in the long run, rather than the initial cost, you would be better off helping something get started on the north-south tollway and its move from Bolling Brook to New Lenox and then letting the users pick up the fee. I—you know, just off the top of my head, I think that the completion of the north-south tollway to Route 80 would probably do more good for the benefit of Joliet.

And I did not get into detail, George, but you know, my grandfather worked at the mill in Joliet, my father worked at the mill in Joliet, and I worked at the mill in Joliet. And when they worked, there were 3,000 people there. Now, there is 150. Caterpillar had 7,000; now they have 3,000. Joliet was once the wallpaper capital of the world. The last one closed maybe six months ago.

So whatever we can get down there to encourage, you know, economic growth and—you know, I do not know if the extension of the north-south tollway is going to, you know, turn out like the east-west corridor did, you know, through DuPage County. But if it did a third of that, we would be highly appreciative.

Mr. SANGMEISTER. Well, just because it is a tollway now does not mean that the extension of it has to be a tollway. You know——

Mayor VALY. Whatever it takes to get it, George.

Mr. SANGMEISTER. I understand.

Mayor CONNOR. I echo that.

Mr. SANGMEISTER. Okay. I know Dennis has worked long and hard on that project, and it is still number one priority, I presume.

Mayor VALY. Yes, sir.

Mr. SANGMEISTER. With all of the municipalities. Do we have a—either one of you—have a ball park figure on what that would cost to complete that?

Mayor VALY. The last figures were in the 277, but that is as a freeway. It has been—the toll road is studying it now. The Governor asked the toll authority to study it. In fact, Mayor Connor and the Mayor of Lockport and I have a meeting with the Executive Director of the toll authority at 2:00 this afternoon to find at exactly where they are at and where their numbers are now.

Mr. SANGMEISTER. Well, counsel has just advised me that in the 1987 highway bill, we designated seven states for construction of toll roads, where up to 35 percent of the cost of the project could be paid with federal funds.

Mayor VALY. I understand that.

Mr. SANGMEISTER. We will be further exploring the toll roads concept in next year's bill, so that is apparently in the thinking. Was Illinois one of the states of the seven?

The COUNSEL. I do not recall.

Mr. SANGMEISTER. You do not recall.

The CHAIRMAN. I do not believe it was.

Mr. SANGMEISTER. Okay.

Mayor CONNOR. Congressman, I would also like to mention. You know, I think the Metropolitan Water Reclamation District is going to be up here shortly, but whatever you could do to continue work on the deep tunnel and those things that will clean up the water north of Joliet. I mean, I dream someday of having a pristine stream go through Joliet. I do not think I am going to live to see it, but maybe we can catch a carp off the Jefferson Street Bridge someday.

Mr. SANGMEISTER. We probably will not re-reverse the river.

Mr. Becker, you spoke very much what I think the Chairman wanted to hear here today, and that is in the general terms of where this Committee ought to be going as far as infrastructure is concerned. Is there anything in particular for your community or any of the other projects? How about the extension? I imagine that is a big item to you—whether or not we extend 431. But, is there any other infrastructure or highway projects in your area that specifically you would like see accomplished?

Mr. BECKER. I think I have always been very critical, even in our own DuPage Mayor's Manual, which is the local agency for reviewing federal projects, trying to understand sometimes why projects had federal interest and really tempted to try to get our committee members to begin to look at things in terms of where was the federal involvement in this? Why was there federal significance to doing one thing or another? I think we have tried to do a lot of things as much as we could using local facilities.

As you know, we have grown from 20,000 in 1970 to over 80,000 people now. So, we have had a tremendous demand on expanding our infrastructure system. We have received quite a bit of funding, I think, in terms of—for highways, for our needs with water and the DuPage Water Commission. We are on a Lake Michigan system or will be within a year when construction is completed, and we have received a number of grants for installation and improvement of our wastewater treatment facilities. But, I think, again, the facilities—there is enough facilities of regional import.

Again, specifically, the expansion of the toll road—or the north-south toll road, I think, would certainly be an advantage to us. The opening of the interchange that Ms. Lindquist referred to is a key part of our system in terms of providing another route of access for people in our community to the interstate system. So, we have seen the federal funding. Again, I could not give you a specific project.

But instead, would like to see an emphasis towards making sure we maintain the investment. And again, I cannot emphasize enough, I do not think there is enough interest or enough importance given to the fact that we have in a lot of ways a very adequate system that we do not take advantage of. We are not timing our traffic signals properly in order to manage the traffic that is there. We are not worrying about the incidents. We block lanes indiscriminately and create these kind of problems that people, for the most part, view that the only solution is to keep building more and more, which is——

Mr. SANGMEISTER. When you complain to IDOT about that, do not you get any help when you tell them, "Look it, I can tell you by just going through our community, those things are not right." Do you get no——

Mr. BECKER. Yes, sir. I think that IDOT is today a lot more responsive than they were ten years ago or five years ago. I see more of a willingness—more of an ear toward understanding some of the things. I remember meetings we would have with them where comments were made by staff members that money was no object, and we built—forced us to build 12-foot lanes, forced us to buy more right-of-way when, in fact, 11-foot lanes would accommodate our needs. I think that there is a responsiveness there now. So, I think whoever has done that—whether that has come directly from Springfield or if it is the efforts in the local district—whatever it is, it is right, and I think we are moving in the right direction.

Mr. SANGMEISTER. Mayor Valy, I think you are probably aware, we happened at 7:00 a.m. in the morning. But, we finally passed the budget, and in that, there is a new five cent gas tax—federal gas tax. But, you should be aware that half of that—and I see from your statement you do not approve of that, and I do not either—but half of it is going for debt reduction. Our backs are up against the wall, too. The other half is going to go into the highway trust fund. But 20 percent of that is being—20 percent of the one-half of the two and a half cents is being set aside for mass transit because the urban areas have their problems as well. But on that top of that right now, that is is all frozen for right now, even though it is going into that particular fund. So, you know, there is not a lot of help in that particular bill. But——

Mayor Valy. Can I comment on that, George?

Mr. Sangmeister. Surely.

Mayor Valy. The Council of Mayors has been working with this Committee specifically on the new Land Transportation Act. And I guess what concerned us was through the years, we have not been able to get any money released out of the trust fund. And, I guess we kind of threw our arms up on that issue, and we proposed a five cent increase in the gas tax to try to help the infrastructure of our system with the conclusion of the interstate system. We were well aware that the rebuilt and the rehab of our current system is going to cost more than the original projects did all along. And we are quite concerned now, as you stated, with this increase in the gas tax and with that money not totally going toward the transportation whether—I mean, I am talking about all transportation, not just highways. And, we feel it is almost impossible now at this point to come again with a new Land Transportation Act and propose the five percent gas tax. I mean, you just gave—five cents—we just put a five cent on another one—would be kind of non-realistic, so I feel we have no recourse at this point, other than to go after the trust fund. I do not know where you are going to get more transportation funds because any increase at this point, I think, is not going to happen, so——

Mr. Sangmeister. Well, as I understand it, there is $17 billion in there.

Mayor Valy. Yes sir, there is.

Mr. Sangmeister. And, we will see what we can do. I know the Chairman was very concerned. We had several meetings of the Committee regarding what was going to happen to that five cents, and I know I speak for him as well that he was not happy with that either. But, when we have the debts that the Federal Government has, there had to be some cooperation, and no one—no particular area wanted to pick up the cost of that, and I did not think it ought to be in the gas tax either, but that is——

Mayor Valy. Transportation infrastructure will help the deficit.

Mr. Sangmeister. That is true. And Linda, I see in your testimony, and I know that is premature at this point, too, but we are all aware of the problem of the bridge. Do we have any—you ball parked it at pretty big numbers in there and kept a pretty big spread. Do you have any idea yet—has there been any ball park figures from your engineers as to what—better ball park, I hope, than you got in your testimony.

Ms. Lindquist. We are developing that now. The village recently approved appropriation of our contingency funding to allow an engineering study to be done of up to $15,000 with some preliminary design and cost estimates. We are still looking at the mid-range—$30 to $35 million. The problem that we have is that it not only spans the river and the shipping canal. It also spans railroad crossing. And to accommodate the height requirements of all three entities, it is going to take a high bridge. They are still looking at the $30 to $35 million.

Mr. SANGMEISTER. Although we have somebody here, I think, that is going to testify later on from the Water Reclamation Service. Yeah, Metropolitan Water, Mr. John—and sorry, I cannot pronounce that last name.

Mr. DIVITA. I am the substitute, Leo Divita.

Mr. SANGMEISTER. Okay, you will be testifying. Okay. Well, my question to her is going to be whether there has been any discussions between the two of you about the possibility of some kind of temporary repairs being made to make that bridge still serviceable. That is—maybe we better pass that question on to him at this time. Do you know whether the village has had any discussions along those lines?

Ms. LINDQUIST. Yes, we have. That was our first response. But, the—and Leo could probably expound upon it much better than I could—but, the bridge is in such a state of disrepair that the costs of repairing it, both in terms of dollars and time, is not feasible. We looked at—the bridge needs to be able to open to allow ship passage on the canal. If it were able to be left in an open or closed position, depending upon your view of it, that might be feasible. But, to allow it to swing, it is not feasible. And the early estimated costs were well over a million and a half to two million dollars and 18 months worth of time. The village took the stance that possibly, we could accommodate a new bridge in that length of time.

Mr. SANGMEISTER. Okay.

Mayor CONNOR. Congressman.

Mr. SANGMEISTER. Yes.

Mayor CONNOR. You know, I do not want to be branded an ingrate, so I do want to tell you that Joliet is very thankful for that three million dollars for the Huboldt Road Interchange. That was critical, and as you know, we are in a locality that needs development. I think that is going to really—we were promised that 25 years ago when Junior College was built, and we are finally getting it. Thank you.

Mr. SANGMEISTER. I was a little concerned in this morning's paper. I hope that that is not true that the county is having some problems and maybe reneging a little bit on——

Mayor CONNOR. I just heard that this morning, too.

Mr. SANGMEISTER. I did, too. I sure hope that is not the case. Well thank you for that.

Thanks to all of you for participating today. I think in the long run, you will find your time well spent here this morning, and I thank you personally.

The CHAIRMAN. Thank you very much.

I did have some names of some people from the Second District, and they were The Honorable David Johnson, Mayor of Harvey; Mr. John Variakojis, Director of Planning of the Metropolitan Water Reclamation District, and those three people—are any of them here? Mr. Variakojis? Mr. David Johnson?

Mr. DIVITA. I will be speaking on his behalf.

The CHAIRMAN. Okay. Why don't you come on up then. And—just the one.

Mr. SANGMEISTER. I believe these were witnesses that were requested by Congressman Savage, so I don't know——

The **Chairman**. I also had some people that were from—do you want just the one? Okay. We will catch the other one then when you get through.

Mr. **Sangmeister**. We can—why don't we take—okay. All right.

The **Chairman**. Why don't you take over, and I will be right back.

Mr. **Sangmeister**. While the Chairman is making his phone call, why do you not then identify yourself, sir.

TESTIMONY OF LEO DIVITA, CHIEF ENGINEER, METROPOLITAN WATER RECLAMATION DISTRICT

Mr. **Divita**. My name is Leo Divita. I am the Chief Engineer of the Metropolitan Water Reclamation District, and I thank Chairman Anderson and Congressman Sangmeister for permitting us to make a statement here today. I am making a statement on behalf of Commissioner Tom Fuller, who is our Chairman of Municipalities for the Metropolitan Water Reclamation District.

The area served by the Metropolitan Water Reclamation District of Greater Chicago encompasses approximately 95 percent of Cook County. This district treats wastewater of some 5.2 million people and industrial flow equal to about another 4.5 million people and includes the wastewater of some 125 villages and suburbs, plus the City of Chicago.

There are two major problems we are trying to solve in the metropolitan area from this agency's viewpoint. One is the pollution of the area's waterways. And two, is the flooding damages.

The continued major pollution source is combined sewer overflows which occur during the heavy rainstorms. Basically, there is about 600 overflow points of combined sewers to the area's waterways. The construction we have completed, plus the construction that is underway picks up about 75 percent of those overflows. So we have been working on solving the problem.

However, we estimate that about 100 times a year, it rains in this area. And the equivalent of about a million people per day of pollution reaches the area's waterways during every one of those rainfall events. So we have estimated that about 22,000 tons of organic pollution is discharged annually to the waterways as a result of these combined sewer overflows. And until we can complete the tunnel reservoir project, I do not believe we can expect the waterways to be cleaned up.

Flooding. Flooding in our area affects 550,000 homes in Chicago and 53 suburban communities, which have combined sewer systems. Of that number, 185,000 homes flood regularly and cause $150 million of annual damages. Flooding in the separate sewer areas which have both storm sewers and combined—and sanitary sewers affect some 90 million—90,000 homes at an annual cost of $20 million of damages.

So the solutions are—of course, we have talked about the tunnel program. We have about 34 miles of tunnel to be completed, with 75 miles already completed. And that will cost about $1.55 billion. Federal and state assistance is essential to complete this vital flood and pollution control program.

Other infrastructure that needs completion in the area is completing the sewer rehabilitation programs mandated by the U.S. EPA and completing what we call on-site detention programs for abating flooding. The Metropolitan Water Commission District has completed a large financial resources toward building the area's infrastructure needs. It has also provided leadership in coordinating the activities of federal, state and regional agencies in our efforts of maintaining the well-being of the residents in the area.

But much remains to be done by all concerned of these constituent agencies. I thank you for allowing us—permitting us to make this statement.

Mr. SANGMEISTER. Okay. Tell me a little bit more about the tunnel program. You say how many miles have been completed?

Mr. DIVITA. About 50 miles have been completed and are under operation. Twenty-five miles are under construction. And that will capture about some 400 of the combined sewer outfalls that now reaches the waterways and goes down to communities, just like the Mayor of Joliet referred to. Sowe still have 34 miles of tunnel to build, which has a cost of about $900 million.

Mr. SANGMEISTER. Has this been a steady program, or it is on and it is off, or has it really been——

Mr. DIVITA. It has been a steady program since 1976, except that this year is the last year of federal U.S. EPA appropriations. And yet, it still is considered, according to the federal law, illegal for combined sewer overflows to discharge into the waterways. However, the total cost of some $900 million is just too large for the residents of the metropolitan area to pick up. So we are looking toward the state and federal governments to assist us in financing. We still—we have participated to the tune of 25 percent of the cost of the project, up until now.

Mr. SANGMEISTER. And the rest has been state and federal funds?

Mr. DIVITA. State and federal funds, correct.

Mr. SANGMEISTER. There is substantial federal funds in this?

Mr. DIVITA. That is correct. There is about $1.2 billion in federal funds that have been—out of the $1.7 that is already completed.

Mr. SANGMEISTER. This tunnel is not just a holding basin, is it? What——

Mr. DIVITA. The tunnel is basically a two-part project. The first project—Phase I, we call it—it is basically a holding basin to capture the first flush, which is considered the heaviest polluted material. Then, once the tunnel itself fills up as a reservoir, which has limited capacity of about one billion gallons, then the remainder discharges directly into the waterways as it previously did. So that—Phase I which is being funded by U.S. EPA is considered a pollution control project—is, in fact, a mini-reservoir for capturing about 85 percent of the spills, which is equivalent to secondary treatment.

Mr. SANGMEISTER. So when the whole project is completed, then, there will be sufficient capacity there for——

Mr. DIVITA. To hold the total 85 percent—it will remove 85 percent of the pollutants now reaching the waterways.

Now the second phase of that project, which is the reservoir program, which is being funded by the Corps of Engineers and 25 percent by the metro district, is a reservoir at the end of the tunnel, which will capture all the excess storm water that is being discharged in the region that goes into the waterways now, which again, when the conditions exist, flood out and back up into the local sewers and also, under extreme conditions, we have to release water into Lake Michigan and pollute our water supply. Now that project has a price tag of about $400 million, but it eliminates a great deal of flooding damages in the area. And as a secondary effect will also capture an additional about 13 percent of the pollutants that now reach the waterways. So, there is a two-fold benefit from the reservoir portion of the entire program, and we are looking forward—we have got our first funding now from Congress this year for one of the reservoirs on what we call Phase II of the flood control portion. And we are excited about it and hope that Congress sees the wisdom of this project and continues to fund it.

Mr. SANGMEISTER. What can you tell me about the 135th Street Bridge?

Mr. DIVITA. The 135th Street Bridge is an unfortunate incident, but it just finally exceeded its useful life. Generally, we look at a bridge for about 50–60 years, and then we talk about total replacement. That bridge, which was built and erected in 1899, just had not had any sufficient metal on it to do any major repairs. It would call for total replacement, that is the only thing. And when one considers that the bridge itself was built during the horse and buggy days, it just does not serve any modern day uses. So what has to be replaced, in my judgment, is a major modern highway structure. Quite frankly, the metro district, its legal charge is in the wastewater business, and we felt we have maintained it substantially during—over the years, and it just exceeded now with Mother Nature taking its toll. The way you build a bridge like that today, you just would not fabricate a bridge the way it is right now. It just captures a lot of salts and pollutants and causes the interiors of all those joints to deteriorate.

And there is metal gone all over the—all over that bridge. There is no way they can make some short-term repairs on that and have the structure function. It is not in the public safety interest to try and do that.

Mr. SANGMEISTER. Well, lining out the other projects and the need for funds that you have also, is that to presume that there is nothing that can be contributed toward the new bridge from you at all?

Mr. DIVITA. I am going to duck that question because there are nine elected public officials, and I think they would certainly entertain something from the communities in the region on that.

Mr. SANGMEISTER. Pleased to hear if there might be something open for consideration on that because there is a certain——

Mr. DIVITA. I think there would be. There certainly is a lot of compassion for the constituents of that area, but we recognize that in 1890, we did separate that community in two. And I think on a statutory basis, we are not required to replace that bridge. But there is certainly a feeling that we would—we are compassionate towards their needs and possibly our Board would consider some support—financial support.

Mr. SANGMEISTER. But your engineers have looked very closely at that bridge and—because, you know, it has been a long—like you say, 90 years. All of a sudden, wham, it is closed. You know, with very little notice to the community. But certainly, safety has got to be the number one priority.

Mr. DIVITA. Safety. But I would rather than have the bad publicity from the sudden closure than I would have to see some bus—school bus or something go down there.

Mr. SANGMEISTER. No question about it. But your engineers have looked at it close enough——

Mr. DIVITA. Very close.

Mr. SANGMEISTER. There is no reasonable way to get another year's use out of that bridge while we attempt to do things here?

Mr. DIVITA. Even just to do some major replacement work would take over a year and a half or two—major replacement.

Mr. SANGMEISTER. That is all I have.

The CHAIRMAN. Let me ask, Mr. Divita, to what extent have you been able to reclaim sewerage discharges? And do you have any information on the savings due to reclaimed water? Is this a viable option, as opposed to our traditional treatment of water that goes back into the river?

Mr. DIVITA. Fortunately, Mr. Chairman, in this area, we have an excellent source of water supply in Lake Michigan, and the economics do not exist for treating the water to the level that one would want to reclaim it for other purposes. However, I may add that the tunnel and reservoir project—I do not know if the Senators and Congressmen are aware of it, but this area is limited by the Supreme Court as to how much water we take out of Lake Michigan for the purposes of water consumption and sanitary engineering.

Because of the tunnel program, the amount of water that has been allocated for potable water by the State of Illinois has been growing because we need less water now for diluting our waste. As we improve our ability to capture and treat waste in the Metropolitan Chicago Area, it releases Lake Michigan water for potable water supply for the surrounding collar suburban communities. So the regional TARP program has a side effect of benefiting the water supply for the whole region because now, we can take Lake Michigan water and bring it out to the collar suburbs and communities.

But reclaimed water is basically projects that are considered in extreme water shortage areas of the western region of our country, and we are fortunate enough to have a large body of water—potable water—like Lake Michigan here so, so far, the economics do not dictate going into the reclamation of wastewater yet.

Mr. SANGMEISTER. If the Chairman would yield for one question.

The CHAIRMAN. Yes.

Mr. SANGMEISTER. There has been an awful lot of requests, particularly from communities in my Congressional district, for allocations to use Lake Michigan water. Do you generally take a position on those requests?

Mr. DIVITA. Yes, we have supported it, and at the same time, asked for linkage support for financial contribution—financial support for the TARP program. We can recognize it is a benefit to the total region if the collar communities can get Lake Michigan allocations, and that depends on how well we are able to clean up the waterways. And the TARP program will clean up the waterways.

Mr. **Sangmeister**. What about the capacity out of Lake Michigan. Not being an engineer, obviously, you do not really know, but I mean, if more and more communities keep drawing out, that is really not a problem?

Mr. **Divita**. That is really not a problem.

Mr. **Sangmeister**. Not a problem at all?

Mr. **Divita**. Right.

Mr. **Sangmeister**. Okay. That is interesting. I did not know that.

Mr. **Divita**. It returns through evaporation and rainfall.

Mr. **Sangmeister**. That is all I have.

The **Chairman**. Well, thank you very much, Mr. Divita, for your presentation.

Did Mayor Johnson get here yet?

And the next panel—Vincent Petrini, George Edwards and Mr. Dietrich Gross. Are any of them here? Oh, good, good.

Let us see. Mr. Vincent Petrini—and you are here—I have got you as the first one here in Mrs. Jibben's place, then Mr. Edwards and Mr. Gross. Okay. You can arrange your order any way you want, but that is the way I got it down here.

TESTIMONY OF VINCENT PETRINI, REGIONAL TRANSPORTATION AUTHORITY, CHICAGO; GEORGE P. EDWARDS, INTERGOVERNMENTAL AFFAIRS OFFICER, CHICAGO TRANSIT AUTHORITY; DIETRICH M. GROSS, CHAIRMAN AND PRESIDENT, MERCURY STAINLESS CORP., WHEELING

Mr. **Petrini**. Mr. Chairman, Congressman Sangmeister, members of the Committee. Thank you for the opportunity to appear before the House Committee on Public Works and Transportation. Before I begin, let me offer an apology on behalf of our Executive Director, Laura Jibben, who was called away due to a prior commitment.

My name is Vincent Petrini, and I am the Senior Public Information Officer for the Regional Transportation Authority of Northeastern Illinois.

Before I describe the RTA's infrastructure needs in our area, I want to thank the Committee for all it has already done to build and rebuild our highways, roads, bridges and transit systems. Your Committee wrote the legislation which built the interstate highway network. You led the fight to gain federal aid for mass transit. You created and stood behind a comprehensive program to rebuild bridges carrying highways and railroads. The fact that you are here this morning holding this Committee hearing shows us that you are continuing that history of seeking ways to be part of the solution to our infrastructure problems.

The issue of infrastructure replacement that you are addressing today has a real and immediate impact on the entire RTA region. In Chicago and its suburbs, we are faced with an enormous challenge. It is a challenge that involves billions of dollars worth of reinvestment in our rail lines, buses, stations and bridges. But it is a challenge that we cannot and we will not let go ignored.

Consider the fact that mass transit in northeastern Illinois carries two and a half million people to work every business day and supplies 980 million annual trips. In the RTA system, there are 1,200 rapid transit cars and 950 commuter rail cars. There are 1,400 miles of track which run over 100-year-old bridges. There are 3,000 buses and nearly 500 CTA and Metro stations. The RTA oversees the second largest transit system in the nation and one of the oldest. Ninety-nine percent of the CTA's elevated structures are more than 75 years old. And yet, every day, millions of people depend on this system.

Those numbers, of course, are simple trivia until it comes to the time where we have to repair these assets. Then, those numbers become real. We are talking about a need of more than six billion dollars in 1987 dollars, and that would be eight billion dollars in present dollars to get the RTA system back to a standard of safety and efficiency that we all must insist upon in the next century.

We have to overcome the reluctance to provide vital funding to this kind of capital programming. We must reinvest in our existing transit system now, for we have put off making these improvements for too long.

In 1989, we took a local step in the right direction by successfully lobbying the Illinois General Assembly to raise our bonding authority by one billion dollars and to provide the financial resources to back the sale of those bonds. The implementation of this program has become the top priority of the RTA.

Over the next five years, more than one-half of our total capital program will come from local sources of revenue.

We understand that the Federal Government cannot afford to fund 80 percent of the cost of mass transit projects as it has in the past. That is why we turned to the local and state funding sources to make up a majority of the resources from our recent capital program. But even with a strong local source of funding, the Federal Government still must continue to be financial partners with us in rebuilding Chicago's transit system.

While we are attempting to cope with dwindling federal resources by increasing our local resources, we must be able to rely on continuing support from Washington. The sporadic needs of other transit agencies cannot become northeastern Illinois' problem in competing for federal funds for long-term infrastructure replacement. While we recognize the need for increased local support, we need to be able to rely on a stable stream of federal dollars to support us as we now begin to retire long-term debt.

Through this strong mix of federal, state and local resources, we have now undertaken the largest capital renovation program in our agency's history and we are just beginning to see our labor paying off.

Engineering studies are currently underway to assess the condition of CTA rapid transit lines. Stations like at Polaski Avenue on the Congress-O'Hare line are experiencing total renovation providing a safer atmosphere for riders. We are planning to rebuild major commuter rail stations. We are making progress and will continue to do so as long as we can depend upon your sustained support.

So that we may follow through in our efforts to make our transit system safe, affordable and dependable, we must be able to find a balance. The threat of lost federal dollars or fluctuating federal commitment will place us in a position that could endanger our entire program. Here, in northeastern Illinois, we have heard the messages from Washington about matching funds and local support, and we have heeded those words. Now, more than ever, we cannot afford to have our federal partner abandon us as we begin to implement the programs our system so desperately needs.

Thank you for the opportunity to talk to you this morning. We at the RTA are looking forward to working with you, the members of this Committee, on challenges related to the infrastructure at the RTA, and we welcome your continued partnership in the future. Thank you.

The CHAIRMAN. Thank you Mr. Petrini.

Mr. Edwards.

[The prepared statement of Mr. Petrini appears on p. 2117.]

Mr. EDWARDS. Good morning Chairman Anderson and Congressman Sangmeister. I am George Edwards, Intergovernmental Affairs Officer of the Chicago Transit Union. I want to thank you for inviting me to testify on the CTA's infrastructure needs.

Public transportation is essential to Chicago's vitality and prosperity. This fact prompted the business community at the turn of the century to build Chicago's rapid transit system. It spurred another generation of these individuals to establish bus service in the 1920s, and it supported decisions made from the 1940s onward to spend public funds for construction of a subway network beneath the downtown area and to extend rapid transit service to outer perimeters of the city. Today, our challenge may be less glamorous, but equally essential, and that is we must maintain the transit infrastructure which is so important to our region.

Today, with gas prices at near record highs and air pollution remains an unsolved problem in our metropolitan region. The availability of convenient, reliable, affordable public transportation is more important than ever.

The Chicago Transit Authority operates the second largest public transportation system in North America. Our service area covers more than 220 square miles, composing the City of Chicago and 37 adjacent suburbs and includes a population of approximately three million. Weekday riding totals approximately two million trips. These trips are predominantly—and that is about 70 percent—trips to and from downtown, the economic center of the CTA's service area.

To provide this essential mobility, CTA operates 2,218 buses on 132 routes covering over 2,100 miles. CTA also operates a rapid transit system consisting of 1,200 rapid transit cars which travel 97.9 miles on six routes with 143 stations.

These assets have a total replacement value of nine billion dollars—that is 1987 dollars. This estimate includes $5.3 billion for track and structures, $1.7 billion for rolling stock, $655 million for bus and rail support.

To keep this aging infrastructure in good working condition, CTA should spend approximately $400 million each year, according to two independent engineering surveys. Compare this to projected capital fund available of about $200 million per year from all sources, and you can see that this translates into just about a 50 percent shortfall.

Recognizing the magnitude of CTA's capital requirements, the Illinois General Assembly in 1989 enacted a program that will provide nearly 800 million new dollars for transit rehabilitation in northeast Illinois over the next five years. Despite increased local participation in transit capital funding, however, CTA still faces the substantial funding gap of $200 million per year. If additional funding is not forthcoming, the Chicago Transit Authority will face very difficult choices. Some may, in fact, require the partial dismantlement of its infrastructure. This would displace riders who in many instances rely upon the CTA for their sole means of transportation. Our needs are as follows:

The Chicago Transit Authority's 97.9 miles of track and structure run above and below and at ground level. Track and structure renewal is a high priority, but the rate of deterioration far outstrips our present ability to renew it. The Chicago Transit Authority must undertake a major structural replacement plan over the next ten years at a cost of up to $230 million annually. This priority alone requires more money than is currently available.

An adequate rail and bus vehicle replacement program requires an average annual expenditure of $84 million.

Many of our buses and rail support facilities need varying degrees of rehabilitation or replacement. For example, the Limits Bus Garage is 78 years old. It needs to be replaced due to general deterioration of architectural, structural and mechanical systems. Our major rail car overhaul facility, the Skokie Shop, is 60 years old. This aging facility needs immediate rehabilitation to provide adequate space and proper equipment for the maintenance of new sophisticated rail equipment. We also have ten rail terminals with yards and service shops. The oldest of these is the 61st Street shop, which was built in 1898.

To keep up with our need to reconstruct or build new bus and rail storage and maintenance facilities, our average annual need is $26 million.

Besides replacing bus garages and terminals themselves, there is the need to replace and/or maintain vehicle maintenance equipment. The cost of keeping the equipment in good working order is $15 million per year.

The recently enacted Americans with Disabilities Act will add capital costs. Future bus procurements will cost approximately $18,000 more per bus because of wheelchair lifts. Renovation of key rapid transit stations must now be completed within 20—in some cases, 30 years—and must include retrofitting for complete accessibility. This project alone will cost an estimated $180 million, or $9 million per year.

We have not had an opportunity to adequately analyze the Clean Air Act, recently passed by Congress. Based on our tracking and monitoring of it, though, it does seem that our worst fears have been avoided. If legislation can drive the technology, we should be able to meet these—the Clean Air standards at a reasonable cost. But reasonable cost is something like beauty, it is often in the eyes of the beholder, and our reasonable, when you have nothing, creates a problem.

As CTA plans for the future, we will continue to look to the Federal Government for substantial assistance. First of all, of course, we will seek direct funding and more of it. Federal appropriation levels over the past ten years have put CTA on a starvation diet. We have done our best with available funds, but we can no longer defer the inevitable—a massive overhaul of our existing infrastructure is essential to our continued viability on our current scale. Avoiding the investment simply shifts the cost of upgrading transit to the costs of upgrading and expanding already overcrowded roadways.

Second, we will look to the Federal Government for new policies governing the use of direct funding. Our current transportation policies favor compartmentalization—highway programs and transit programs each stand alone in the statutory authorization, annual appropriations and program administration. As a result of this compartmentalization, local transportation planners have little flexibility to program available funds to achieve the overall goal of improving personal mobility in the Chicago region.

Congressman Lipinski has proposed an innovative answer to the problem of this compartmentalization—the comprehensive urban transportation program. We are impressed with this as a first step, and we intend to be working closely with the Congressman and with the gentlemen and ladies of this Committee in the future on this legislation.

Once again, I thank you for the opportunity to be with you this morning and look forward to working with you in the future. Thank you.

The CHAIRMAN. Thank you, Mr. Edwards.

Mr. Gross.

Mr. GROSS. Senator Anderson, Congressman Sangmeister. My name is Dietrich Gross. I am the Chairman and President of Mercury Stainless, and I was invited by Congressman Lipinski to address road construction deficiencies.

We have all been delayed uncountable times in our travels on American highways due to bottlenecks developing because of road construction. Our decaying highway system seems to make road construction and repairs ever more necessary, and the irritation of drivers and passengers keeps growing and growing.

We are here today to discuss with you possible remedies to this ongoing situation, and I want to present to you a solution that the German government found to be very helpful during the 1960s and 1970s. During this period of time, Germany's highways consisted mostly of two lanes, plus one emergency parking lane, for a total of three lanes in either direction. The German government ordered from the German steel manufacturer, Krupp, steel decks to bypass the area under construction. The steel deck was constructed in such a fashion to use the two lanes plus one parking lane as a base for a steel deck of four lanes, laid out to allow continuing traffic on two lanes in both directions. The traffic flow was slowed down somewhat because the individual lanes were somewhat narrower. Nevertheless, the result was a continuing good flowing traffic pattern which avoided the backup and gridlock.

Today in Germany, most highways have been converted to three lanes plus one, and for those highways, the steel deck is not necessary any more. However, residual areas of two lane traffic are still in use and also under repair. And from what I understand, the next time a steel deck will be used will be early in 1991 in the area of Munich.

The usefulness of the steel deck was calculated in Germany in the following fashion:

If we have a car density of 10,000 cars per hour on any given highway and the traffic approaches a road construction area, delays of up to 30 minutes are not uncommon. In an eight-hour day with a 30-minute delay per car, to a density of 10,000 cars, we are looking at a total of 40,000 lost hours. In those 40,000 hours, we would estimate that an additional 100,000 gallons of fuel were burned and at an earnings rate of $10 per hour for each passenger, we look at an income loss of $400,000, for a total of $500,000 per day between the passengers' earnings and the 100,000 gallons of fuel.

Intangibles have to be added to such—to that, such as wear and tear on the car, lost connections to airline schedules, delays to reach hospital emergency rooms, delays on missed meetings, not to forget possible accidents, et cetera. The question arises, how many of these traffic delays do we have on each given day in every state of the union? If we assume that we have three heavy construction sites in each state, then we are looking at one and a half million dollars times 50 states, or a total of $75 million a day, or $2.7 billion annually to be the economic impact of traffic delays in our country.

To use a steel deck is not inexpensive. The price, obviously, depends on length and width of the deck that is used. Let us assume we are looking at 1,000 feet with four lanes, two lanes in either direction, for a total lane width of 48 feet, with an average lane width of 12 feet. Then we are looking at 40,000 square feet. The price tag of such a deck would be between $8 to $9 million, and that is a German price tag, which is about ten years old. I have had no opportunity to look into American efficiencies which probably bring the price down substantially. This segment is reusable and can be repaired and moved to the construction site fairly easy. One or two steel decks could service an entire state for a long period of time.

To offset the cost of such steel decks, you might look at an increase in the license plate fee or the sticker price of $2 each. With such a remedy, we could avoid many of the endless delays that we are presently enduring and guarantee more even traffic flow very much for the benefit of the driving public.

I have added to this speech copies of an English translation giving a brief description of the deck's usefulness for your consideration.

I want to thank you for your attention and hope that the solution which I am offering would find your approval. I recognize that this solution might be only one of several which you are considering. However, it has been proven to be very useful in Germany and might prove to be equally practical in our country.

As a final note to these remarks, I might add that the German government has about 6,000 running feet of steel deck available, and to the best of my knowledge, would be agreeable to sell a portion to the United States in case we find an interested party who wants to try out this method of bottleneck prevention before it is decided to develop a road program incorporating steel decks in individual states or beyond. Thank you very much.

[The prepared statement of Mr. Gross appears on p. 2089.]

The CHAIRMAN. Thank you, Mr. Gross. Mr. Gross, have you brought these steel decks to the attention of the State Highway Department?

Mr. GROSS. Not yet.

The CHAIRMAN. Not yet. I would also—also, Mr. Edwards, you touched a little bit upon costs of the clean air. I had a question. As you consider the cost involved to solve the transportation problems of the region, including the cost of complying with the mandates of the Americans with Disabilities Act—that is a legislation we passed—and the Clean Air legislation, how do you see the financial burden being shared by the federal, the state and the local governments?

Mr. EDWARDS. How do I see it as being shared? Right at this point, I do not think it is being shared. Without—we have not—the regulations on the ADA have not come out yet. We really have not had a chance to analyze the Clean Air legislation yet. These are all factors that—the dollar amounts, we just have not been able to get a grip on it. I do not know what the Federal Government can do. It seemed very willing to put the mandates there without a source of revenue for it. Realistically, we do not know what is available at this time. We do not know what the Federal Government can do.

What would I like them to do? I would like at least a reasonable sharing of the cost. But, where is the money going to come from?

The CHAIRMAN. That is a problem we always have to figure out. I know—part of my district is Long Beach, California, and we had a problem on the Americans with Disabilities Act. But we also have a lot of people down there who felt that we should give them proper treatment, and we did. And now, we find that it is paying for it—almost paying for itself. The increased amount of use by having lifts and things on it so disabled can be taken care of. And I think almost each—you almost have to kind of figure how things are going in your district, in your state or however it is.

I know a moment ago, the other panel mentioned the issue of tolls. And 25 years ago, I was Chairman of the Toll Bridge Authority in California, and I was Chairman of that for eight years. And it is kind of a funny issue. We know people do not like them. But we also know that the people do like them. It just depends on how you read them—how you look at it. I happened to build one of my toll bridges in my area. It—we collected enough money so it has totally paid for itself 100 percent plus. We felt, "Well, let us not charge tolls any more." But the people said, "Let us just make it toll free one way." So if you go to the east, it is free. If you go to the west, it costs two bits, or whatever it is. And yet, we have done some checking and found that the people who pay—who do not go free, almost all of them come back and pay. All they do is have to drive a half a mile up and they could miss it. But they, apparently—and we are making money. And we do not need it any more because the bridge is built. But we are just sending money up to Sacramento, and the people down there do not even want to stop that. Frankly, I would like to see it stopped, but the people down there do not.

So it is kind of hard to know how—and somebody mentioned a moment ago that we did allow seven states to collect tolls. You know, every state used to have tolls. And then, we got this feeling against it nationwide well, we should not have toll roads. I know it was pretty strong in California we pretty well eliminated them, except that we notice now that different areas want to have tolls for certain things. And matter of fact, I had one in my area, which is kind of out in the country, but they wanted to develop the area. And they said one of the ways to get federal money, you have got to have matching funds. And so, they got permission to put up two toll roads to collect money to raise matching money so they could participate in the state and the federal government and pick up their local share that way. And we find little variations all over the country. And I suppose that is something you have to look at, but you know, that is—you make the decision the way you want it.

And, somebody asked, how did the seven states—we permitted seven states—we first had them apply to us. And then, we turned it over to the Secretary of Transportation to kind of check in this. And then they gave it to us, and I was the author of the bill that took the seven states in, and I included my own state, but I limited them to two tolls down in that area where they wanted to raise the money to raise the matching money. And so it is something that I think—there was a time that every place you went, there were toll roads seemingly. And then we abolished them, everybody got tired of them. Now, there is a kind of a sentiment, let us charge them toll because you can collect the money fairly easy.

I am not supposed to do the talking here. I talked too much that time. Any of these that I did not—I think I will let you do it, rather than my doing this one here. Mr. Sangmeister.

Mr. SANGMEISTER. Can you refresh my recollection? It has been awhile since I have been in the L.A. General Assembly. Of course, when the RTA was constructed—was it 1972, 1974—I forget what it was. It was a very controversial thing, particularly in the area that I represent, Will County, at that time. I know subsequent to that time, we got that quarter cent sales tax. Is that quarter cent that is collected in the collar counties—is that segregated for mass transit facilities in the collar counties, or is that taking into the RTA in their general funds and used accordingly?

Mr. PETRINI. Yeah. In 1983, Congressman, as you realize, the RTA was reorganized and that was when we saw the implementation of the sales tax, including the quarter cent sales tax in the collar counties. That is matched by a one cent sales tax in the city and in Cook County. And what that—those funds come together in a pool, and the Regional Transportation Authority allocates those sales tax funds, which is approximately presently $400 million a year, 40 percent of our operating costs, to the service boards, the Chicago Transit Authority, Metro Commuter Rail and PACE and for new projects. So, they are not specifically spent in the collar counties that they are collected in, but they are used for regional projects.

Mr. **SANGMEISTER**. Okay, so you do not take the one cent and set it aside for the CTA and the other?

Mr. **PETRINI**. Right.

Mr. **SANGMEISTER**. But, did you say proportionately, it works out fairly well from the sources that it is being collected because that has always been a problem?

Mr. **PETRINI**. Right.

Mr. **SANGMEISTER**. Pretty close.

Mr. **PETRINI**. Yeah. We will always have arguments——

Mr. **SANGMEISTER**. I hate to pin you down on that but I was just kind of curious as to how that was being done.

Mr. Edwards, you need a lot of money. You have got a lot of problems. And I guess the Congress apparently did not help it too much with the American Disabilities Act, but it is something, as the Chairman has indicated, that we all felt its time had come, and I guess we are going to have to obviously help you in financing a good portion of that. What about the CTA overhead? You know, just a person going into the city and looking? You know, first place, I might say to you and it is probably for good reason, they look like they are going to fall down. I am sure they are not.

Mr. **EDWARDS**. No, they are a long way from falling.

Mr. **SANGMEISTER**. But you know, we talk in the Congress about what are called mag lev, you know, and fast rail and all that. Is that applicable at all to an inner city transportation system like the CTA, or is that only strictly for long-shot rail?

Mr. **EDWARDS**. It is my understanding that is more of a long haul type thing. And I do not know if it would be possible within a dense urban area to use the maglev.

Mr. **SANGMEISTER**. Okay. Is there any—I mean, what eventually—obviously, as you indicated in your written testimony and your oral, that these things are all wearing out. Is it the program for the CTA to just rebuild all those bridges? Is there any—for the so-called loop downtown, is there any thought about bringing that down to ground level? I do not know why you would probably want to do that, but——

Mr. **EDWARDS**. For the foreseeable future, I think we are going to—we will probably keep investing in the EL. I think also there is the downtown circulator that will probably alleviate some of the problem in the downtown loop type area.

Mr. **SANGMEISTER**. We got into a discussion, and Congressman Lipinski, who could not be here today, was in the forefront of trying to amend the American Disabilities Act to the standpoint of making it a little more palatable for you, which did not succeed. But when—because I forget just how it was—if you know, when do you have to start making provisions on those cars—by what year or what—do you remember off-hand exactly what the Act——

Mr. **EDWARDS**. I think you are thinking more of the METRA issue.

Mr. **SANGMEISTER**. That is true. That is right. Yes, you are right. I am sorry. You are right.

Mr. **EDWARDS**. Our primary concern——

Mr. **Sangmeister**. How does that relate to your operation? It is METRA that I am thinking of, you are right.

Mr. **Edwards**. We will be able to comply with the accessibility to the cars. Once again, I hate using the term "reasonable expense" when you are in a position like us. What is reasonable? Our primary concern revolves around key stations in that loop area where you have subways and the EL which stops at almost every corner, where you get into making those accessible. If we had to make every one of them accessible, it would just be astronomical. Thanks to the Committee's help, we were able to get that within the bill report there are distances of recommendation—recommended that will help that. Those are very, very expensive projects, as you can well imagine. But I think that Chairman Anderson's point, can you attract a ridership that will make up for it? Maybe you can in the long run, but I just—it would be an awful long-term project to do that.

Mr. **Sangmeister**. Well, there is a lot of people out there that feel a whole new horizon is going to open for them, and we certainly hope it does.

Mr. **Edwards**. Oh, we certainly hope so, too.

Mr. **Sangmeister**. And we certainly hope they use it, and I know you do, too.

Mr. **Edwards**. Sure.

Mr. **Sangmeister**. Well, only the future will tell us that.

Mr. Gross, I have never heard of this concept before. What you are talking about is a temporary steel structure to carry motor vehicles while a certain section of a road is being repaired? That is what we are——

Mr. **Gross**. That is correct.

Mr. **Sangmeister**. How adaptable—you indicate that this is reusable. The state could purchase one or two of those and reuse it.

Mr. **Gross**. Yes.

Mr. **Sangmeister**. Well, some roads that are being repaired curve, some are straight, some are two-lane, some are four-lane—I mean, how does this all adapt out?

Mr. **Gross**. It can be dismantled and trucked to the next location, or there can be an ongoing construction on one side of the highway, while the other side of the highway is covered with a four-lane road that is going on as the highway is being repaired. You have attached to this testimony here some pictorial explanation as to how——

Mr. **Sangmeister**. Oh, I did not see that.

Mr. **Gross** [continuing]. The highway works, when it is fully dismantled or when it is fully laid out. And it shows you how easy it is to transport these segments from place to place. There is a reasonable—there is a reasonably short period of time.

Mr. **Sangmeister**. Could you give us an estimate, if you were to go to a location and going to set up the temporary highway. How long does it take to get it in place approximately—a week, two weeks, a month, two months?

Mr. **Gross**. It is almost no more than 48 hours to pick it up.

Mr. **Sangmeister**. Forty-eight hours?

Mr. **Gross**. Yes. And bring it to the next location.

Mr. **Sangmeister**. That is an interesting concept. I thank you. I have not seen that before. I do not know whether anyone else has or not, but I think the suggestion—that you ought to be talking to the State of Illinois Department of Transportation. This is maybe something that has some merit to it.

That is all the questions I have, Mr. Chairman.

The **Chairman**. I have not seen it used very much, except I was in New York about ten days ago. I see they are doing it on their bridges. Almost every one has got the steel top. Several of them. They just bring it in and move it and fix it and then move it to some place else, and they do it pretty quick. So if you have not seen it, you can go up there and see what they are doing.

Mr. **Sangmeister**. Interesting. You learn something every day, as they say.

Mr. **Gross**. There you go.

The **Chairman**. I thank you very, very much, and we will invite our last panel. Again we have witnesses from Congressman Sangmeister's 4th District. Mr. Peter Waldock, Planner for the Village of Plainfield; the Honorable Robert C. Stefaniak, Mayor of Calumet City; and Ms. Barbara F. Sloan, Transportation Planner for the South Suburban Mayors and Managers Association. And then additional, I would like to invite Mr. Wayne Jackson from Mayor Johnson's office in Harvey, Illinois. You can do it that way. You can choose your own—one, two, three four. I have down here Waldock, Stefaniak, Sloan and Jackson. So that is one order, but you can reverse it as far as I am concerned. Okay.

TESTIMONY OF PETER J. WALDOCK, PLANNER, VILLAGE OF PLAINFIELD; HON. ROBERT C. STEFANIAK, MAYOR, CALUMET CITY; BARBARA F. SLOAN, TRANSPORTATION PLANNER FOR THE SOUTH SUBURBAN MAYORS & MANAGERS ASSOCIATION; WAYNE JACKSON FOR HON. DAVID N. JOHNSON, MAYOR OF HARVEY, IL

Mr. **Waldock**. Thank you, Chairman Anderson. Representative Sangmeister, Committee members. On behalf of the Village of Plainfield and the Village President, Mary Latta, I wish to express my thanks for the opportunity to provide testimony before this Committee.

The deterioration of public infrastructure is a serious concern which must be addressed at all levels of government. Only through a concerted effort can progress be made in rebuilding and maintaining existing public infrastructure upon which we will depend.

To best explain the conditions of local infrastructure in Plainfield, allow me to provide a brief background of our community. The Village of Plainfield is Will County's oldest community. Established in 1829, Plainfield predates the formation of the County itself. The neighborhoods of the central core area of the village are filled with historic churches, homes and businesses. Transportation systems such as the Elgin, Joliet and Eastern Railroad, the Lincoln Highway and U.S. Route 66 originally helped spur development in our community.

Today, Plainfield, is a rapidly growing community of about 5,000 people. The new residential subdivisions are being developed to the north, south, east and west. Road systems, such as Illinois Route 59 and 126, U.S. Route 30 and Interstate 55 serve our community. The EJ&E Railroad continues to provide rail services via two lines through the village.

In a village such as Plainfield, financial resources are limited. While private funds by developers provide capital to install infrastructure in new subdivision developments, local funding is required for maintenance and repair of all systems. Costs are also—are incurred when updating infrastructure to meet ever-increasing state and federal regulations for water quality and environmental protection.

As a result of Plainfield's mixture of old and new development, local infrastructure has a broad range of needs. Older neighborhoods still are served with two-inch and four-inch water mains. Water towers are aging and are in need of major maintenance procedures. Some combined sanitary and storm sewer lines are still in operation. Problems resulting from storm water inflow and infiltration must be resolved. Several local streets are without curbs and gutters and storm sewer systems. In some areas, streets are narrow, having been built prior to modern transportation methods.

The EJ&E railroad viaduct over Illinois Route 59 is dangerously narrow, making it difficult for two trucks to pass in opposite directions simultaneously. The viaduct also experiences flooding during heavy rains. Funding has not been available for the needed improvements. Route 59 is a major regional highway serving over 20,000 vehicles daily.

Plainfield is not alone in its need for infrastructure upgrades. The burden on local government is too great to bear alone. For this reason, assistance from federal and state levels is required to meet our community needs.

Again, I wish to thank you for this opportunity to express our concerns.

[The prepared statement of Mr. Waldock appears on p. 2131.]

Mayor STEFANIAK. Chairman Anderson, Congressman Sangmeister. The City of Calumet City is in an ever-ending effort to upgrade and rehabilitate its sewer, water and roadway utilities. Calumet City was initially developed on a street-by-street expansion, whereby as development occurred, sewer, water and roadway improvements were extended to accommodate new growth. As time went on, the system utilities aged, became deteriorated and in need of repair. Calumet City now faces a major crisis in the rehab of its underground and roadway utilities. We have spent over $10 million in storm sewer improvements and approximately five million dollars in street improvements and repaving within the last few years to keep abreast of utility deterioration. But the funds are not enough to take care of the 100 miles of streets, sewer and water mains the city has to maintain.

The major improvements that require immediate attention are two-fold.

Roadway improvements: 156th Street, 156th Place from Burnham Avenue to the state line are considered two of the oldest streets within the city. They were built in the early 1900s with materials and construction methods that were then considered state-of-the-art. Throughout the years, the streets have deteriorated to a point where repairs are becoming very difficult and not cost-effective. Both streets are faced with collapsing sewers, water main breakage and pavement failure on a regular basis. It is not uncommon to excavate a portion of the roadway to repair what appears to be a small sewer break and find that 20 to 50 feet of sewer needs to be replaced because of its crumbling condition. The same situation holds true for the water main due to age and brittleness. Furthermore, cast iron and galvanized mains no longer recommended for modern day designs break due to stresses of age.

The solution to the problem requires total reconstruction of the roadways. This means the entire roadway surface, including blacktop, concrete curbs, gutters, sidewalks need to be removed along the below-ground water mains and sewers. New ductile iron water mains and concrete sewers are needed. New catch basins, valve vaults and manholes are required. Once complete, the roadways are completely renovated and will devote decades of consistent service to the community. The estimated project cost, including construction and engineering for these two roadway improvements, is $2,277,166.

Improvement Number 2. Flooding in Calumet City has been a continuing problem. The city has addressed flooding in various wards and has spent over $10 million in the resolution of the problems at various locations. However, the flooding continues at other locations. The improvement I speak of has not yet been solved due to the funding plight that Calumet City has. The residents of these wards have suffered phenomenal tragedies of personal property destruction because of our financial inability to solve the flooding. Bids were taken over one year ago to determine the project costs of $2,571,387, but no action was ever taken on these bids. Plans, specifications and bid documents for these two projects are complete and await funding.

Complete specifications and engineering studies on these recommended infrastructure improvements have been submitted to this Committee under separate cover.

Thank you for the opportunity of presenting this testimony before the Committee. I may add, the total cost of both projects is $4,848,553. Thank you.

[Data on additional infrastructure improvements in Calumet City appears on p. 2187.]

The CHAIRMAN. Thank you, Mr. Mayor.

Ms. Barbara Sloan.

Ms. SLOAN. Thank you, Mr. Chairman and Congressman Sangmeister. I am here today representing South Suburban Mayors and Managers Association. Our Association is a multi-municipal organization representing 39 municipalities in southern Cook and eastern Will Counties. As such, the Metropolitan Planning Organization for Northeastern Illinois has designated our Association the Regional Council for this area, responsible for the review, evaluation and recommendations regarding transportation projects of all modes in the southern suburbs of the Chicago Region.

I am pleased to have the opportunity to testify at this hearing of the Committee on Public Works and Transportation regarding the rebuilding of infrastructure in our nation. The Transportation Committee of South Suburban Mayors and Managers Association is particularly interested in the new surface transportation legislation and has been active in following its progress through our involvement with the Chicago Area Transportation Study. On behalf of the Transportation Committee, I wish to convey to you some of the issues which concern our Association regarding the upcoming legislation.

Since the mid 1950s, the major focus of surface transportation in the United States has been the interstate highway system. With that system very near completion, it is time to redirect our focus toward a transportation problem of a somewhat different nature: mobility in our urban areas. If left unaddressed, the problem of urban congestion may reach proportions which could bring our major metropolitan areas to a crawl, thus threatening our national economic vitality. The new Surface Transportation legislation should be directed toward the solution of this problem. An increased proportion of federal funding should be provided to our nation's urban areas for the purpose of relieving this congestion.

In regard to the Federal Aid Urban Highway Program, our Association is very supportive of the continuation of this concept in the new legislation. This program has been extremely successful in the south suburbs as it has been in the entire Chicago Metropolitan Region since its inception. We strongly encourage the continuation of this program or one very similar to it in which local elected officials have the ability to select and program highway projects on a designated system of roadways which includes those under local jurisdiction. Through this mechanism, priority funding may be identified at the local level in the context of regional planning. Local government is assured a role in maintaining and developing the urban transportation infrastructure. As is currently the case, the program should continue to function as a pass-through process in which a portion of federal dollars goes directly to the local level. A maximum federal share of the funding split should be specified, but with an overmatch provision, as in current legislation.

Finally, there is certainly no public works or transportation issue more vital to the Chicago Metropolitan Regional area, including northeastern Illinois and northwestern Indiana, than the construction of a supplemental commercial airport. Due to the fact that the Chicago region is such a critical center of air traffic for the entire nation, the successful development of a supplemental airport in the shortest time possible is also important to the nation as a whole.

We certainly appreciate the support of the members of this Committee for the ongoing bi-state study process which began one year ago and which is scheduled to be completed next October. It is our expectation that the conclusion of the site selection phase of this process will produce the best site for the region as a whole.

The consulting team, in cooperation with the states of Illinois and Indiana, the City of Chicago, the FAA and the other federal, state and local agencies, is made up of extremely qualified experts. We believe that if the technical process remains fair and in compliance with all laws and regulations, with a minimum amount of partisan politics and subregional parochialism, the best site will emerge.

We ask your assistance and that of the entire Congress to help our region accomplish these goals through: One, your continued interest in the process, assuring that it remains a technically fair one; two, continued funding for the site selection and master plan phases of the process, and; three, once the region and the FAA come to a consensus on the preferred site, we request adequate federal assistance to commence land acquisition, airport construction funds and funds to build the necessary highway and mass transit infrastructure to support this new airport.

Together, we have a unique opportunity to construct an airport for the 21st century to serve the Greater Chicago Metropolitan region and, indeed, to serve the nation.

On behalf of the Transportation Committee and the entire membership of South Suburban Mayors and Managers Association, I wish to emphasize the importance of the above items being addressed in any upcoming transportation legislation. We at the local level are depending on the sound judgment of your Committee to create a new transportation program which will enable our nation to retain its economic prominence through an efficient and well-maintained transportation network. Thank you.

The CHAIRMAN. Mr. Jackson.

[The prepared statement of Ms. Sloan appears on p. 2121.]

Mr. JACKSON. Thank you. Good morning, Chairman Anderson and Congressman Sangmeister. On behalf of Mayor David Johnson, I would like to convey his apologies for not being able to make it here this morning.

The City of Harvey is a mature suburban community with a variety of infrastructure needs. The City of Harvey has a population of approximately 35,810 persons, according to the 1980 Census. Located in suburban Cook County, Harvey is approximately ten miles from Chicago and 16 miles from the Chicago Loop. The City has moderately dense residential land use, a stabilized industrial base and viable commercial corridors and industry because of its infrastructure, as well as county and state roadway and interstate highway access. However, today more than ever, its continued economic survival and progress depends on its aging infrastructure, which in the past, has been one of the City's greatest assets.

Incorporated in 1891, Harvey is a home rule unit. Historically, the City has been a transportation, business, commerce and industrial hub for the south suburbs. The City's most developed commercial corridors have been the Halsted Street area, the 154th Street area, Central Business District, Dixie Highway and 147th Street, Sibley Boulevard. The Halsted Street Highway commercial corridor near Interstate 80 has done well with newly constructed commercial buildings being built over the past three years. Some of the other commercial corridors have not done as well because of older obsolete commercial facilities and infrastructure, as well as competition from new commercial and industrial properties in the region.

The City of Harvey has listed an estimated cost for 5-year infrastructure improvement plan. This plan would include the following improvements and amounts: $50 million for rebuilding the underpass and viaduct at U.S. Route 6, which needs to be widened to four lanes because of traffic congestion; $1,912,000 for storm and sanitary sewer rehabilitation city-wide; $17,500,000 for storm sewer construction through existing residential, commercial and industrial areas. This will improve existing drainage and make additional residential and industrial areas economically viable for development; $3,875,000 for street rehabilitation and resurfacing which will provide for the reconditioning of existing streets; $2,380,000 for sidewalk, curb and gutter replacement and installation citywide; $4,925,000 for new parks and equipment to provide recreational services to underserved areas and replace facilities and equipment; $572,000 for removal and replacement of water line valves; $675,000 for water main replacements citywide; $978,000 for street and thoroughfare lighting for commercial and residential areas with traffic hazards; $1,600,000 for new sanitary sewer extensions into existing residential areas with septic tanks and services to developable lots; $3,700,000 to upgrade of Illinois Route 1, consisting of widening, resurfacing, adding turning lanes and traffic signal modernization. Also enclosing storm water collection providing for curbs and gutters. Because of increasing traffic volumes over the years and the lack of left turn lanes, all intersections within a 12-block area have reported higher traffic accidents and fatalities. This plan—this was planned improvement by the—this was a planned improvement by the State of Illinois Department of Transportation. However, in recent years, many of the projects planned by the State Department of Transportation have been continuously moved back in programming year or deleted because of funding constraints; $200—$2,000—I mean, sorry, $2,500,000 for school district major renovation and construction for some of our aging schools; $54,000 for acquisition and construction for additional parking for the city's municipal center building; $100,000 for municipal center building requires construction of an elevator and renovation of restrooms to make it handicap accessible.

The total for these projects on a 5-year plan is $90,771,000. The above estimate of infrastructure improvements represent the estimated total cost of five-year capital improvement plan to address most of the City of Harvey's current and anticipated needs.

That concludes my testimony. And again, on behalf of Mayor Johnson and the City of Harvey, thank you for the opportunity to be here.

[The prepared statement of Mr. Jackson appears on p. 2107.]

The **Chairman**. Thank you, and we appreciate having the benefit of your remarks.

Now, in order to bring new industry or provide for expansion of existing industry, it often requires beefing up existing infrastructure. Are potential new businesses coming to look at your communities with some kind of an infrastructure shopping list, and have you been able to respond to their requests? Do any of you want to answer?

Mayor **Stefaniak**. Yes, the City of Calumet City, as I indicated in my earlier testimony, has spent approximately $15 million for the past 12 to 13 years on infrastructure improvements. I think that when a major economic development comes into a community, they take into consideration all of those positives and negatives which confront the local community only because from the standpoint they do not wish to be coming in and be burdened with additional real estate taxes to have to improve on these things. So yes, very definitely, we have addressed those situations in Calumet City.

The **Chairman**. Well, what are some of the financing techniques that communities such as yours consider in order to meet these capital spending needs?

Mayor **Stefaniak**. Well, what we have, we have an economic person who deals directly with these businesses. We have districts we are currently looking at. We have enterprise zones, which we have been extremely successful with. I do not have the exact numbers, but the numbers are somewhere like approximately $400 to $500 million in new businesses. Now I think we have to understand that with the enterprise zone, we will not receive any tax benefits for the first ten years. The same as some of our school districts have gone along with. But these are some of the major things which we do to encourage business, and we currently have a substantial amount of economic programs on the table in the City of Calumet City.

The **Chairman**. Well given the difficulties that you are coping with, what do you see as the most critical infrastructure need that could be an incentive to attract new industry, and where do you think your greatest help should be coming from—the state, the Federal Government——

Mayor **Stefaniak**. I think it should be coming from——

The **Chairman**. Or perhaps even the private sector.

Mayor **Stefaniak**. It should be coming from a combination of both. I think the residents of our community, as indicated by our previous bonding ability, receive approximately one-half million dollars a year from CDBG funding. This goes for residential rehab of about $150,000 and $350,000 for updating our sewers and things of that nature. So we have really—the people of Calumet City—paid more than their fair share to continuously upgrade our infrastructure and our systems, and we are looking to the federal and state governments for additional revenue to keep these systems upgraded.

Mr. **Waldock**. If I might also comment on that particular issue. We in Plainfield use private funds primarily for our infrastructure growth at this time. But we are also in a competitive market. It is sometimes not realized, I guess, that municipalities compete against one another for businesses and for growth and development. But we in Plainfield are in a competitive area in Will County. And it is not adequate any more just to depend on private dollars for our growth because a developer can go elsewhere. The community, obviously, is going to benefit from the tax revenues generated by industrial and commercial entities, as well as all types of development. That is where the other funding sources are going to be significantly important, especially to the smaller communities, such as Plainfield, which cannot adequately compete with larger neighbors.

Ms. **Sloan**. If I might answer that from a somewhat regional perspective. I think that we have found through a number of economic development studies that we have done in the past few years that the major deterrent for economic development in the south suburbs in general is the lack of a third airport in our area. And we feel that this is going to bring—this will be the one thing that will bring economic development and everything else that goes with it.

The **Chairman**. Mr. Sangmeister.

Mr. **Sangmeister**. Yes, thank you, Mr. Chairman.

Mr. Waldock, for years and I have driven under it many times, that viaduct on 59, you wonder whether two cars are going to be able to pass underneath there, and it has been that way and that road carries a tremendous amount of traffic. Has there been any discussion with the village at all with the EJ&E Railroad—that is the EJ&E that goes over, is not it?

Mr. **Waldock**. Yes, that is correct.

Mr. **Sangmeister**. Yeah. Has there been any discussion with them at all as to any kind of a cost sharing on that, or is their position is hey, our railroad is there. The bridge is there. It is going to be somebody else's problem that you are going to have to change it.

Mr. **Waldock**. Basically, the village has been looking to the Department of Transportation for—as the primary funding source and design source for that improvement. It is a part of Illinois Route 59, as you are aware. But it is a significant thoroughfare through our area, and I think it would be worthwhile for the village to consider putting some money into the kitty, if you will on those funding improvements. The——

Mr. **Sangmeister**. But you really do not think the railroad would contribute a dime, huh?

Mr. **Waldock**. The railroad has not been a part of the funding picture, to my knowledge, at least up until this point.

Mr. **Sangmeister**. Has your engineer got a ball park figure on what it takes to—I suppose if you are going to expand that bridge, you probably will want to make it four-lane wide underneath there, I would presume, would you not?

Mr. **Waldock**. That is—that is correct. That is what——

Mr. **Sangmeister**. So what would it cost to knock that out and expand that bridge? Have you got any idea?

Mr. **Waldock**. I really do not have that information, but the cost is significant, at least in comparison to the number of people we would have to spread it over—5,000 population.

Mr. **Sangmeister**. Well, if you get any information from your engineer as to what the estimated cost is, I would like to know.

Mr. **Waldock**. Okay.

Mr. **Sangmeister**. Several years ago, the Federal Government had a great program for sanitary sewer improvements in the cities and villages. In fact, they were funding it up to 75 percent through the state, but they were—it was federal funds. I do not know how long you have been with the community, so maybe you do not know the answer to the question, but was there any effort made—you know, you had to pass a bonding referendum locally to pick up the other 25 percent. Did Plainfield make any effort at that time—talking about four years ago, three years ago?

Mr. **Waldock**. Well, that does predate my time in Plainfield, so I really am not equipped to answer that.

Mr. **Sangmeister**. But, you do need—you have got a sanitary sewer problem out there, and a lot of cities and villages really took advantage of that 75 percent federal funding. But you do not know why——

Mr. **Waldock**. We—I believe we missed the boat on the 75 percent money. Our sanitary sewer plan is up to EPA standards presently, but was done with local funding.

Mr. **Sangmeister**. Maybe the referendum was not—maybe the referendum did not pass. I do not recall independently either.

Mr. **Waldock**. I do not recall.

Mr. **Sangmeister**. Okay. All right.

Mr. **Waldock**. But yeah, we do have a significant sanitary sewer plant. A concern in that—the plant itself is also located within the floodway of the DuPage River and probably ultimately will need to be relocated to be in an ideal condition.

Mr. **Sangmeister**. Mayor Stefaniak, you and I have talked several times about the problems you have got in your community, and I am glad you are here to let the Chairman know what kind of problems you have got. Okay. Again, it is awful hard, and I suppose maybe I should not be doing this, but I am trying to get a handle on what our communities need in this district. And you have got two big projects, the one being the roadway improvement and the other being the storm sewer.

Mayor **Stefaniak**. Correct.

Mr. **Sangmeister**. Are you willing to put a priority between the two? Not that—I am sure in your mind, they are fairly equal. But if you had the alternative that you had to——

Mayor **Stefaniak**. If I had the alternative, I would go with the one to resolve the flooding situation.

Mr. **Sangmeister**. Okay.

Mayor **Stefaniak**. And I think the community would accept that accordingly.

Mr. **Sangmeister**. And I know that your community has been willing to bond itself over the years and contribute their share. That would be the same on this project?

Mayor **Stefaniak**. That is correct, sir.

Mr. **Sangmeister**. Okay.

And Barbara, you indicated in your testimony that you are concerned about urban congestion in the new highway program, and I think your remarks are well taken in that regard. Has the South Suburban Mayors and Managers Association—do they have a position on how much we should be doing in mass transit, as compared to roadway improvement because I presume mass transit has got to be a part of the solution to urban congestion?

Ms. **Sloan**. That is correct. We have—we supported all of the concepts that the Chicago Area Transportation study has come up with as far as urban congestion. That does include rapid transit, as well as highways. We do have several priority projects we would like addressed in regard to mass transit in our area, one of them being the—a freight line which currently runs from the City of Chicago to Crete. Now, we would like to see that reinstated as passenger service, and we would like to see that addressed. That could also possibly serve as a potential service to one of the airport sites that is being addressed.

Mr. **Sangmeister**. Okay. Speaking of airport sites, which is always something we are all talking about these days. Of course, as you know very well, I agree with you 100 percent that we need that third airport.

The **Chairman**. I was going to ask Ms. Sloan that question. I was going to ask her what district would that be in.

Mr. SANGMEISTER. Well I do not know if she wants to answer that or not. I was going to ask her whether or not—I know the position of the Association has been to take no position on any particular site that is under consideration, but——

Ms. SLOAN. We feel like any of the sites under consideration would benefit the south suburbs.

Mr. SANGMEISTER. Well, does that mean that your Association would accept the site at Lake Calumet?

Ms. SLOAN. Well we are supporting the study process, and whichever site comes out of that study process——

Mr. SANGMEISTER. That was not the question. The man sitting to your left may have a little difference of opinion with you on that particular site. Well, I think, yes, it is. It will be the economic boon that we need, although I really think that that is a difference of opinion. I understand that. We ought to pick a site and work toward it because I think if we do not, we may very well lose—I think it is losing the site to Lake Calumet. We are going to have some 26,000 people displaced up there, and I think we ought to be concerned about that, and I know Stefaniak is as well. But, everybody has to take their own position on it.

Mayor STEFANIAK. Now let me just clarify something, Congressman, if I can. You asked me what my priority was, and of course, that flooding project funding would be the appropriate one. The only problem is, that particular project is in the proposed runway for the Lake Calumet third regional airport.

Mr. SANGMEISTER. So, you do not want your problem solved that way, do you?

Mayor STEFANIAK. No. So, going along with Ms. Sloan and the entire South Suburban Mayors and Managers Association, I am totally opposed for the record for that airport on the southeast side of the City of Chicago. So that being the case, then of course, my priority would be the two roadway improvements, if the unfortunate should happen.

Mr. SANGMEISTER. That is understood.

And the City of Harvey certainly has a few problems, too, do not you?

Mr. JACKSON. Yes, sir.

Mr. SANGMEISTER. I see you have delineated them very well here, and you know, they will be a part of the record, and we will be taking a look at all of those projects as well. Okay?

That is all I have, Mr. Chairman.

The CHAIRMAN. I want to thank all of the witnesses who appeared before us today for their excellent statements. This was a good informative hearing. The testimony received will be helpful to us as we work to put together a national infrastructure program.

And George, I want to compliment you for putting together this hearing. And George, special thanks to you for your hospitality and to your staff for working to make things run smoothly. And I am sorry I did not get a spot for that third airport, but that is all right.

Mr. SANGMEISTER. Well, you still are in a position to have something to say about that, Mr. Chairman. And also, thank you, and I know you want to get on your way home. We have a long tough session, and you want to get back to California. And I appreciate your taking the time to come here to squeeze us in after the original hearing was canceled. Thank you very much.

The **Chairman**. Again, thanks to all of you, and the Committee stands adjourned. Thank you very much.

[Whereupon, at 12:09 p.m., the committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

Naperville

October 4, 1990

U. S. House Committee of Public Works and Transportation
Congress of the United States
House of Representatives
Washington, D.C. 20515

Dear Committee Members:

Thank you for the opportunity to offer comments relative to the program for rebuilding of our public works infrastructure. The thrust of my comments are based on the transportation and solid waste elements.

In regard to transportation, I think there are two distinct challenges facing us today.

The first is the need to develop programs that will assure that our very intense investment in transportation facilities is maintained. Taxpayers have invested literally multi-billions of dollars in building a system that is unequalled in the world. Unfortunately the cost of maintaining those facilities in the long run, usually cost more than the initial investment.

I suggest a greater emphasis needs to be placed on the maintenance efforts in order to guarantee retention of these facilities. The focus of that attention needs to begin at the highest level, which is from Congress. I would also suggest that any further investment in new facilities should be dependent on a commitment from the responsible agency for maintenance of the existing systems.

I also think that before we simply embark on a program to replace everything that exists today, that a requirement be made that alternatives be reviewed in order to determine whether or not the existing improvements are the most appropriate. We have learned much since the initial construction of these elements of the infrastructure. There are in many cases, more cost effective solutions.

CITY OF NAPERVILLE • P.O. BOX 3020 • NAPERVILLE, IL 60566-7020 • 708/420-6111

The second challenge facing us today is to determine how best to invest dollars into the transportation system of the future. I realize that may not be the specific objective of this hearing but I would like to at least offer comments relative to the future investment.

I suggest that much more attention needs to be directed at more effective incident management. Incidents are defined as anything from accidents to utility repairs. It has been shown through documented federal studies that half of the congestion that exists today is the result of incidents as opposed to capacity restraints.

What this is going to require is more awareness on the part of those individuals charged with maintaining and developing the transportation infrastructure. It will be necessary that everyone who has a role in the transportation system will have to be aware of this problem and work together to reduce this 50% figure. Obviously, we are nowhere near effectively utilizing the system that is already in place.

In regard to the matter of solid waste, which by the way we in Naperville prefer to call resource recovery, I don't feel that there should be an emphasis on worrying on how we are going to replace existing facilities such as landfills and incinerators. Instead, I think our efforts should be directed toward finding ways to reduce, renew, and recycle our resources so that we don't have the need to try to burn up or cover up these needed resources.

I am convinced that in regard to the issue of resource recovery, we all know what we have to do. It is a matter of making a commitment to do it. I see the need for a federal focus in the areas of education and encouragement to do the right thing. The actual delivery of the service should be maintained at the local level.

Thank you for your consideration of my comments.

Very truly yours,

Ned P. Becker, P.E.
City Engineer/Director
Department of Transportation

dg

cc: Ron Miller

Comments of the Mayor of Joliet, Illinois
before the U. S. House Committee on
Public Works and Transportation
October 6, 1990
(HON. CHARLES P. CONNOR)

Mr. Chairmen:

I would like to thank the Committee for the opportunity to address you today and advise you of the infrastructure needs of the City of Joliet.

Joliet is a City of approximately 80,000 people located approximately 40 miles from Chicago. Joliet is a City that meets its challenges head-on. Joliet is addressing infrastructure needs in four areas. These areas are water supply and distribution, sewage collection and treatment, storm water drainage and transportation.

Funding in excess of $130,000,000 is required for the repair, rehabilitation and replacement of existing infrastructure. Costs could reach as much as $180,000,000 if the new public water supply project requires the use of Lake Michigan as a source.

Water distribution and supply needs have a cost range between $55,000,000 and $100,000,000 . Joliet's existing water supply is from wells that suffer from a declining water level and radium concentrations that exceed the Drinking Water Standards. To address this situation, Joliet is currently involved in the design of a project to obtain water from the Kankakee River. Due to regulatory constraints established on withdrawals from the Kankakee River, Joliet is also investigating the possibility of obtaining an allocation of Lake Michigan water as an alternative project.

The development of a new water supply will cost between $40,000,000 and $50,000,000 for a Kankakee River Project and $60,000,000 to $80,000,000 for a Lake Michigan Project. Either project will require the replacement of over 50 miles of distribution piping that has been in service more than 50 years. This piping has excessive leakage. This replacement will cost between $15,000,000 and $20,000,000.

Joliet is completing $22,500,000 of construction of treatment facilities at the Joliet Eastside Sewage Treatment Plant. The next phase of wastewater projects is the elimination of combined sewer overflows. Combined sewers transport stormwater and sanitary sewage for treatment. This method was the accepted practice 40 years ago, however, separate systems are now required to eliminate the infrequent overflow sewage into streams and rivers during heavy rainfall. infrequent overflow during rain fall events. Joliet is using local funds to construct separate storm sewer collection systems that connect to previously constructed major storm sewer interceptors. It is anticipated that at the current rate approximately 20 years will be required to complete the construction of the necessary separate sewers with an estimated cost of $30,000,000.

Additional storm sewers are necessary on many streets in Joliet. This additional drainage will cost approximately $10,000,000 and is necessary to properly drain streets and allow reconstruction of deteriorated streets.

The reconstruction of the streets in the areas where new storm sewers are constructed and the reconstruction of the streets that have deteriorated will cost $50,000,000. Street reconstruction each year costs Joliet approximately $ 1,250,000 and improves approximately 1.5 miles of street each year. At this rate more than 40 years will be required to complete the construction.

Joliet is also responsible for maintenance on 21 bridges within the City. Of these 21 bridges, 6 bridges has been identified as requiring rehabilitation or replacement. Joliet is working to complete this construction work, however, annual funding of $ 50,000 each year is not adequate to meet the current demand. Many of the bridges are more than 50 years old and have served their useful life and are due for replacement.

It is apparent that Joliet is making considerable investment in infrastructure, however the requirements exceed the ability to fund projects. Rehabilitation and reconstruction of the existing infrastructure is necessary to provide necessary municipal services to the residents.

I trust that this information will assist the committee in its understandings of the infrastructure needs of cities throughout the nation.

I would like to thank you again for the opportunity to address the committee today.

Testimony of Gloria Bryant, Mayor of Ford Heights, Illinois before the House Subcommittee of Public Works and Transportation.

Mr. Chairman, distinguished members of the panel. I take this opportunity to express my gratitude to you and especially to our own representative Congressman George Sangmiester for holding this fact-finding hearing in our area and for giving me this opportunity to present testimony today.

My name is Gloria Bryant and I am the mayor of The Village of Ford Heights, Illinois. The problem I wish to address this morning is one of water quality. A problem that has served not only to distress our citizens, but, has been singular in impeding economic growth in our community.

Perhaps the best way to begin, is to provide you with a brief history of Ford Heights and establish the context for the problem I will be discussing.

Ford Heights was incorporated as the Village of East Chicago Heights, Illinois immediately following World War II. The original settlers were soldiers returning from the War and Chicagoans seeking an alternative to urban living. The social structure consisted of urban middle class, factory workers and migrants from the rural South.

Over the past two decades we have witnessed a steady erosion of our middle class residents. As our children became better educated and career focused, they left home. Due to increases housing opportunities in surrounding areas and the absence of available housing in Ford Heights, they do not return.

The net result is that our village has become, increasingly, a community of low income families and senior citizens. The 1980 Census showed the per capita annual income for Ford Heights to be less than $5,000; distinguishing us as the poorest urban community in the United States. The erosion of our Middle Class produced a corollary devaluation of our basic assets and a shrinking revenue stream in the face of rising operating cost.

One important and dependable source of revenue over the years has been our water. Our water system consisted of five wells which produced an abundance of water, enabling the Village to sell water to neighboring industries and communities. Both the City of Chicago Heights and the neighboring Ford Motor Company Stamping Plant were important customers for our water and provided much of the revenue needed to provide essential public services to our citizens.

In 1986 Chicago Heights began purchasing Lake Michigan water, and in 1987 Ford Stamping Plant was annexed to Chicago Heights. Their stated reason for annexation to Chicago Heights was that the quality of water purchased from Ford Heights caused sufficient damage to their equipment and machinery that maintenance and repair costs became unacceptable.

I talked recently, with a cosmetic manufacturer who was looking for a South Suburban location for a new factory. In frank terms, he advised me that Ford Heights could not be considered as a possible site due to our water quality. There are many similar stories I could bring you. All of which have the same ending.

Technically, our water is safe. Both EPA and private laboratory results show that our water meet minimum standards for potable water. The iron and hydrogen sulfide levels are below maximum limits for drinking water as established by EPA.

The practical fact, however, is that our water is of limited use to our citizens and of no value to commerce or industry. Our water has a reddish brown color because of high iron content and has an offensive odor caused by high hydrogen sulfide levels.

We find ourselves caught in a chemical aberration where our water quality meets accepted EPA standards, but, is offensive to human senses and unfit for industrial use.

I would like to submit, for the record, a recent report from Mr. James W. Wilner, Chief Engineer for American Water Works Service Company, Inc., the nations largest owners and operators of well systems. Mr. Wilner inspected our water system and reviewed EPA and private laboratory analysis for the past 12 months. His conclusion was the same. The water meets minimally acceptable standards, but is of no practical use.

The solution to our dilemma can only be determined by a comprehensive study that will better define the problem and weigh the feasibility and cost effectiveness of various alternatives. Our engineers estimate that a study of our water system would cost $30,000. This brings us back to our problem of inadequate revenues to provide necessary public services. While the cost of this study may seem paltry to the average municipality, it represents half the annual payroll for our Public Works department. The trade-off is unworkable.

In the meantime the competitive edge afforded by our land and transportation assets are neutralized by the intractable problem of our water quality.

I come to you with this problem seeking a solution. Moreover, I seek a solution that can be implemented before 1992. The industrial and commercial opportunities already lost can not be recovered. We also know that without immediate action, the chance for capturing industry will continue to decline.

I thank you for your attention and I make myself available for your questions and recommendations.

MERCURY STAINLESS CORP.

DIETRICH M. GROSS
CHAIRMAN AND PRESIDENT
MERCURY STAINLESS CORP.

Background:

Mercury Stainless Corp. is a totally backward integrated producer of stainless steel flat rolled products with an annual sales volume exceeding $450 million.

Mr. Gross (Mercury's 100% shareholder) has over 30 years experience in the steel industry.

From the mid-1950s until the early 1970s, Mr. Gross was a sales representative for several German steel and specialty steel companies. His sales territories included Europe, Scandinavia and the Far East. Just prior to founding Mercury, he established and was president of a U. S. steel service center operation owned by a German company.

Mr. Gross studied in Germany and earned the equivalent of a BA degree in Economics. He is also a member of the Steel Service Center Institute.

10/90

PUBLIC WORKS AND TRANSPORTATION COMMITTEE

MEETING ON OCTOBER 6, 1990

HOLIDAY INN, MATTESON, ILLINOIS

Ladies and Gentlemen.

We have all been delayed uncountable times in our travels on American highways due to bottlenecks developing because of road construction. Our decaying highway systems seems to make road construction and repairs ever more necessary and the irritation of drivers and passengers keeps growing and growing.

We are here today to discuss possible remedies to this ongoing situation and I want to present to you a solution that the German government found to be very helpful during the 1960s and '70s. During this period of time, Germany's highways consisted mostly of 2 lanes plus 1 emergency parking lane for a total of 3 lanes in either direction. The German government ordered from the German steel manufacturer, Krupp, steel decks to bypass the area under construction. The steel deck was constructed in such a fashion to use the 2 lanes plus 1 parking lane as base for a steel deck of 4 lanes, laid out to allow continuing traffic on 2 lanes both directions. The traffic flow was slowed down somewhat because the individual lanes were somewhat narrower, nevertheless, the result was a continuing good flowing traffic pattern which avoided the backup and gridlock.

Today in Germany most highways have been converted to 3 lanes plus 1 parking lane and for those highways the steel deck is not necessary any more. However, residual areas of 2 lane traffic are still in use and also under repair and from what I understand, the next time a steel deck will be used will be early in 1991 in the area of Munich.

The usefulness of the steel deck was calculated in Germany in the following fashion:

If we have a car density of 10,000 cars per hour on any given highway and the traffic approachs a road construction area, delays of up to 30 minutes are not uncommon. In an 8 hour day with a 30 minute delay per car, to a density of 10,000 cars, we are looking at a total of 40,000 hours of lost time. In those 40,000 hours we would estimate that an additional 100,000 gallons of fuel were burned and at an earnings rate of $10 per hour average, we look at an income loss of $400,000 for a total of $500,000 per day.

Intangibles have to be added such as wear and tear on the car, lost connections to airline schedules, delays to reach hospital emergency rooms, delays on missed meetings, not to forget possible accidents, etc. The question arises, how many of these traffic delays do we have on each given day in every state of the Union? If we assume that we have 3 heavy construction sites in each state, we are looking at $1.5 million times 50 or a total of $75 million per day or $2.7 billion annually to be the economic impact of traffic delays in our entire country.

To use a steel deck is not inexpensive. The price obviously depends on length and width of the deck that is used. Let us assume we are looking at 1,000 ft. with 4 lanes, 2 lanes in either direction, for a total lane width of 48 ft. with an average lane width of 12 ft. We are looking at 48,000 sq. ft. or a price tag of between $8 and $9 million. This segment is reusable and can be repaired and moved with the construction site fairly easily. One or two steel decks could service an entire state for a long period of time.

To offset the cost of such steel decks you might look at an increase in the license plate fee of $2 or of the sticker price of $2 each. With such a remedy, we could avoid many of the endless delays that we are presently enduring and guarantee more even traffic flow very much for the benefit of the driving public.

I have added to this speech copies of an English translation giving a brief description of the steel deck usefulness for your consideration.

I want to thank you for your attention and hope that the solution which I am offering here would find your approval. I recognize that this solution might be only one of several which you are considering, however, it has proven to be very useful in Germany and might prove to be equally practical in our country.

As a final note to these remarks I might add that the German government has about 6,000 running feet of the steel decks available and to the best of my knowledge would be agreeable to sell a portion to the United States in case we find an interested party who wants to try out this new method of bottleneck prevention before it is decided to develop a road program incorporating steel decks in individual states or beyond.

STEEL DECKS FOR HIGHWAYS

Technique and Experiences: H. Sedlack
Friedrich Krupp, Mechanical & Steel
Engineering, Rheinhausen

Historical Background

Since the beginning of the '60s, the necessity to repair the older highways in Germany (often having been built in the '30s as a preparation for the war), was steadily rising, and so was the number of building sites.

The known process of restoration up to this point was to close down those lanes which were in poor condition. This was done over a few miles, often over a period of several months, diverting the traffic onto the neighboring lane, transforming the two-lane one way traffic into a one lane traffic of opposite directions.

The consequence was a reduction in capacity of the highway of 75%. Because of this, the traffic would obviously slow down considerably, or even jam up over many miles resulting not only in an enormous amount of time lost, but also in a rising number of accidents. Both of these factors not only represent a personal loss, but an economical one as well.

Because of the public getting restless about the situation, the construction industry made suggestions as to how bottlenecks could be avoided. Most of their ideas turned out to be useless because the problems and technical difficulties outweighed the gains of time saved as well as road safety. One example of this would be the building of temporary steel bridges over the construction site.

Krupp then made the suggestion of diverting the traffic not over, but around the site, simply by building a quickly assembled steel road. Thus, the motorway would be widened by flat steel panels, one right next to the other and projecting in such a way beyond the edge of the highway, making up for the lanes which were under construction. This resulted in a four lane highway again (although rather narrow).

Since this seemed to be a realistic idea, Krupp, being commissioned by the German government, began to develop the steel road. Being the first project of its kind and having no prior experiences to fall back on, Krupp built a test road of 1 kilometer. This first steel road was then opened to traffic in April, 1964, on the highway Frankfurt-Kassel. Using the information that was gathered on the test road as well as this steel road, they reshaped and improved its construction to fulfill certain requirements.

First of all, its plates and tracks, as well as the equipment, had to be easily transportable. Then it needed to be set up quickly and efficiently, and at a later date could be dismantled again to be used at another site.

Furthermore, one not only needed to take into account the weight of the material itself, (for instance, a single steel plate weighed approximately 4.2 metric tons), but also the constant and substantial stress created by the moving cars and trucks on the whole structure. Finally, the steel roads had to be applicable to curves and to bridges.

The road consisted of plates which were 12.25 mm long, 2.4 mm wide and 30 cm high. They were laid out side by side and perpendicular to the flow of traffic, and mounted onto parallel steel tracks which were laid on the emergency parking lanes of each side of the highway. These tracks are responsible for distributing the weight and pressure evenly over a long stretch of road. Furthermore, noise reduction was aided by shock absorbers which consisted of rubber ledges laid down between the steel plates and the steel racks.

To overcome the different levels between the highway and the steel road, the surface of the latter being 0.5 m above the other, ramps were used. These were 5.7 m in length with a slope of 2% grade and allowed a smooth transition between the highway and the steel road. Furthermore, ample accessories such as curbs and crash planks gave the steel road the necessary road safety.

Finally, finding the right panel surfacing proved to be difficult. Krupp tested approximately 30 different coverings but only a few were successful. These were made of a highly durable material and possessed a rough, grainy quality. The final covering was synthetic and consisted partly of tar being 6 mm thick.

An absolute necessity for the steel road to prove itself useful is the ability to assemble and disassemble it quickly. As it turned out, a stretch of 1 km was set up in approximately 20 hours.

Conclusion: By using the steel road, it was soon shown that traffic jams at building sites could be avoided.

Mercury Stainless Corp., 475 Allendale Drive, Wheeling, IL 60090
(708)459-6060

THE KRUPP STEEL ROAD

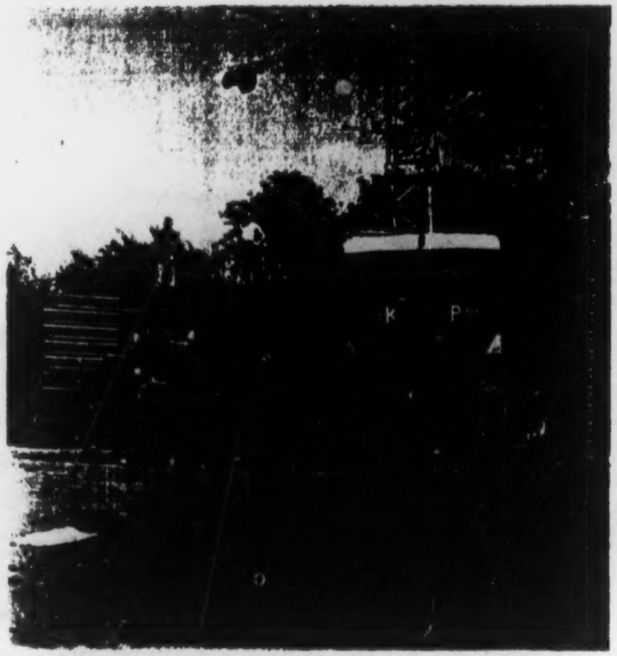
The KRUPP STEEL ROAD is a quick-assembly road for heavy motorway traffic.

It is used along motorway road works when two of the four lanes are blocked by the works.

With the KRUPP STEEL ROAD two lanes of the motorway are widened by flat steel panels one placed beside the other and projecting beyond the edges of the road in such a way that they can support a, rather narrow, four-lane road panel.

Technical Data of the KRUPP STEEL ROAD Type 3:

Loading	Class HS 20-44 (AASHTO)
Width	2.4 m
Length	12.25 m
Height	0.304 m
Overall structural height	0.5 m
Weight per plate	5.7 t, 2.6 t/linear meter
Road panel surfacing	Synthetic coating
Accessories	Supporting beams Crashplanks Road marking Curbs

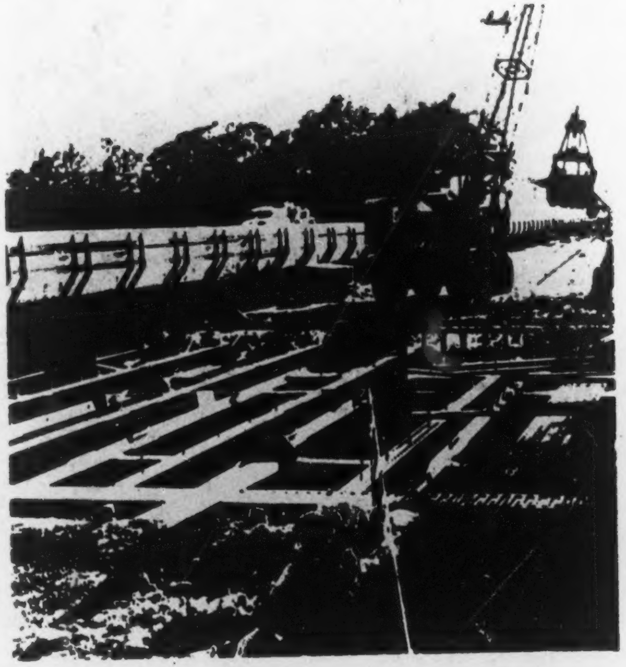


1. In order to ensure a smooth flow of traffic even along road works, the Ministry of Transport keeps approx. 2,000 liner meters KRUPP STEEL ROAD structures on stock in special stores.

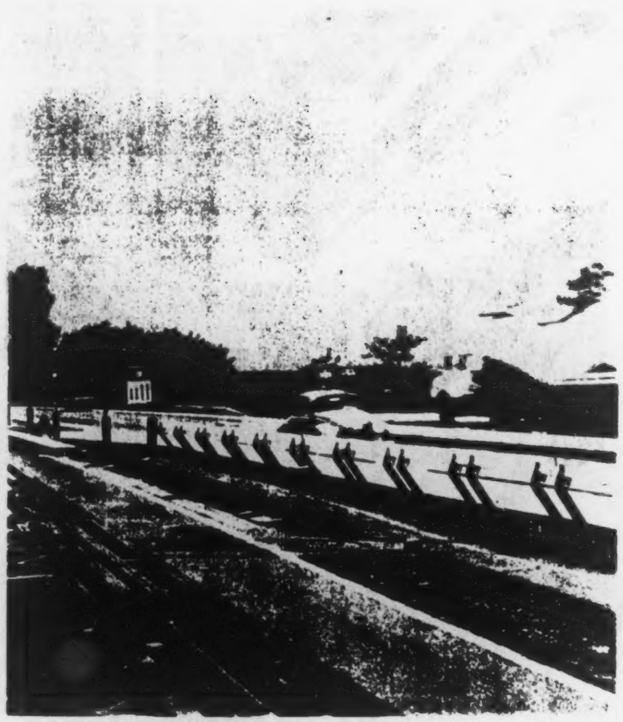
2. The plates of the KRUPP STEEL ROAD are transported to the place of use on flat-bed trailers.

3. The plates are lifted off the flat-bed trailers and placed onto the supporting beams using a crane.

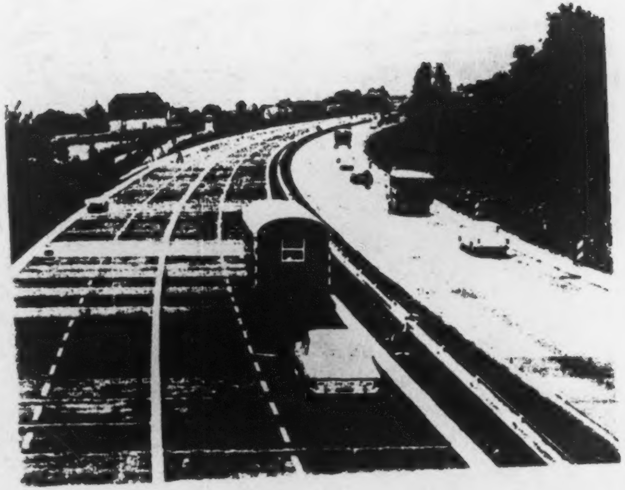
4. Ample accessories such as curbs and crashplanks give the steel road the necessary road safety.



5. Traffic can move in four lanes over the KRUPP STEEL ROAD even along bridge jobsites.



6. The KRUPP STEEL ROAD is suitable for heavy-truck traffic up to class HS 20-44.



7. The KRUPP STEEL ROAD can also be laid in curves.

With a gap width of approx. 28 mm the curve radius would be approx. 1,000 m.

OFFICE OF THE MAYOR
HARVEY, ILLINOIS 60426

DAVID N. JOHNSON
MAYOR

CITY OF HARVEY

INFRASTRUCTURE NEEDS

The City of Harvey is a mature suburban community with a variety of infrastructure needs. The City of Harvey, Illinois has a population of approximately 35,810 persons, according to the 1980 census. Located in the southern suburban Cook County, Harvey is approximately 10 miles from Chicago and 16 miles from the Chicago Loop. The City has moderately dense residential land use, a stabilized industrial base and viable commercial corridors and industry because of its infrastructure, as well as, county and state roadway and interstate highway access. However, today more than ever its continued economic survival and progress depends on its aging infrastructure, which in the past has been one of the City's greatest assets.

Incorporated in 1891, Harvey is a homerule unit. Historically, the City has been a transportation, business, commerce, and industrial hub for the south suburbs. The City's most developed commercial corridors have been the Halsted Street area, the 154th Street - Central Business District, Dixie Highway and 147th Street (Sibley Boulevard). The Halsted Street highway commercial corridor near Interstate 80 has done well with newly constructed commercial buildings being built over the past three years. Some of the other commercial corridors have not done as well because of older obsolete commercial facilities and infrastructure, as well as, competition from new commercial and industrial properties in the region.

LIST OF INFRASTRUCTURE NEEDS:

1.	$50,000,000 -	Rebuilding underpass and viaduct/bridge for U.S. Route #6 underpass which must to be widened to a two lanes because of traffic congestion.
2.	$ 1,912,000 -	Storm and Sanitary Sewer rehabilitation city-wide.
3.	$17,500,000 -	Storm Sewer construction through existing residential, commercial and industrial areas. This will improve existing drainage and make additional residential and industrial area economically viable for development. (Includes correction of Wood Street drainage problems.)
4.	$ 3,875,000 -	Street rebuilding and resurfacing which will provide for the reconditioning of existing streets.
5.	$ 2,380,000 -	Sidewalk, curb, and gutter replacement and installation citywide.
6.	$ 4,925,000 -	New parks and equipment to provide recreational service to underserved areas and replace facilities and equipment.
7.	$ 572,000 -	Removal and replacement of water line values.
8.	$ 675,000 -	Water main replacement citywide.
9.	$ 978,000 -	Street and thoroughfare lighting for commercial and residential areas with traffic hazards.
10.	$1,600,000 -	New sanitary sewer extension into existing residential areas with septic tanks and for service to developable lots.

11. $3,700,000 - Upgrade of Illinois Route 1 consisting of widening, resurfacing, adding turn lanes, and traffic signal modernization, also, enclosing storm water collection providing for curb and gutters. Because of increasing traffic volumes over the years and the lack of left turn lanes, all intersection within a 12 block area have reported a high traffic accidents and fatality level (area between 159th and Halsted St.). This was a planned improvement by the State of Illinois Department of Transportation, however in recent years many of the projects planned by the State D.O.T. have been continuously moved back in programming year or deleted because of funding constrains.

12. $2,500,000 - School Districts' major renovation or construction for some of your aging area schools.

13. 54,000 - Acquisition and construction for additional parking for City's municipal center building.

14. 100,000 - Municipal center building requires construction of an elevator and renovation of restrooms to make it handicap accessible.

$90,771,000 TOTAL ESTIMATED 5 YEAR PLAN COST

Note: The estimate does not consider a asbestos removal program from public buildings.

The above estimates of infrastructure improvements represent the estimated total cost of a Five (5) Year Capital Improvement Plan to address most of the City of Harvey's current and anticipated needs.

STATEMENT OF LINDA LINDQUIST

VILLAGE OF ROMEOVILLE
13 MONTROSE DRIVE ROMEOVILLE, ILLINOIS 60441
(815) 886-7200 (708) 655-9019

Romeoville, in Will County, Illinois, is not your typical suburban, bedroom community. We are a Village of approximately 16,000 people, mostly "blue-collar" families. Homes were built in the postwar period with $100 down and $100 a month mortgages. We have about 35 miles of streets. We operate our own water, storm sewer and waste water facilities. We also have our own police, fire, and ambulance department as well as recreation facilities. We don't rely on other fire and police protection or recreation districts to provide services to our residents. Reflecting the mixed heritage of most of our people we have a combination of Yankee stubbornness to take care of our own; and southern gentility that defines "own" very broadly. This seems fairly common for a local municipality, but there is more.

Romeoville sits in the heart of the most prime industrial development land in the state. Growth projections for our area provided by the Illinois Department of Transportation and the Northeastern Illinois Planning Commission astound us. With our available land, utilities, and transportation facilities, we are in the center of an area that is attracting major players in the nations corporate and industrial development.

We didn't get into this position by accident. A few years ago the Village looked at what could be done to spur economic growth in a stagnant community. This growth was vital to generate revenues needed to support existing infrastructure needs through development of new revenue sources. Among other items, our staff determined that we needed an interchange off the I-55 interstate at Weber Road. After a coordinated effort by the Village officials and staff, the state highway department, the county and developers interested in the area we knew we had a good idea. The state planned an interchange in this area within the next ten years, but we needed it immediately. The State agreed to move the interchange up on it's calendar - if local funding was found to match half of the estimated cost of $14 million dollars. To the surprise of many, we did it! Two developers each contributed 1.5 million dollars, Romeoville sold the farm - literally - to contribute 1.2 million Will County contributed a portion of its available FAU funding to make up the balance. As a result, approximately 24 months later, the Romeoville interchange will open on November 1.

In a self congratulatory burst of exuberance, we felt as if we had worked a miracle. However, our experience with miracles is limited. And we are finding the supply is not endless.

Over the past 89 years, we have have struggled with the normal infrastructure demands that most communities face, providing streets, water and sewer systems and sidewalks as our Village grows. We've also had to deal with repair and replacement of most infrastructure in the past few years as our Village reaches an age where it seems as if everything is falling apart at once. Through long range planning, capital improvement financing, and creative use of time, energy and staff we have almost been able to hold our head above water. New revenues generated by growth are funneled into capital needs programs, but the growth is so new that the anticipated revenues have not fully materialized. The two year (temporary) income tax surcharge enacted by the State of Illinois has been of immeasurable assistance. In the past twenty four months we have rebuilt over twenty nine streets in our community. Some of which had deteriorated to gravel roads. None of which would have been possible without the additional funding. If funding were to continue, we could begin addressing collapsing storm sewers and water mains. While planned replacement is needed very badly, this is not my main topic.

The Village lies in the northern portion of Will County. The Chicago Sanitary Shipping Canal and the DuPage River cuts through the Eastern third of the community. It is this portion of the community that houses approximately 40 homes and four businesses. This area represents about one-half or the Village assessed valuation of $117 million dollars. It is considered to be a primary entrance into the Will County growth corridor. In the past two weeks, this area has become of critical concern to Romeoville and the surrounding communities.

On September 20, we were notified, with no prior warning, that the Metropolitan Water Reclamation District of Greater Chicago had closed the ninety year old swing bridge that connects the eastern and western portion of Romeoville. This caused village officials to scramble to ensure that there was no loss of safety related services to the area. This was not easily accomplished, as the nearest alternate routes to that area add 20 to 30 minutes to our response time. When you are dealing with police and fire calls this is unacceptable. Temporary agreements with other agencies were hastily struck.

Although the Metropolitan Water District of Greater Chicago was certainly aware that at ninety years, the bridge had outlived its estimated life span of 50 years, this was the first time extensive testing had been done to determine how sound the bridge was. It was declared unsafe for vehicular traffic after engineering and ultrasound testing found that as much as 50% of the infrastructure had decayed due to rusting and corrosion.

The District has no plans to renovate a bridge of this age, that is understandable. They also claim no responsibility for providing a new structure, which is still debatable. They also had not planned in the past forty years for a bridge replacement fund. Basically, we've been told that if Romeoville needs a bridge, it is up to us to take care of things. With a twenty to fifty million dollar estimated price tag, this is not something Romeoville can accomplish alone.

This is the concern I wanted to bring to your attention. In this situation, there are about six agencies all pointing the finger at each other, disclaiming responsibility.

Replacement of infrastructure is difficult enough when authority or responsibility is clearly defined. In cases such as this, it becomes a frustrating and time consuming experience. Romeoville is committed to getting involved. We feel that no effort by a single agency can overcome the scale of reinvestment or cut across the jurisdictional barriers. Had we been notified 40,20,even one year ago of the Districts long range plans, or lack of one, we would have become involved before this situation reached a crisis.

This ninety year old structure provided necessary transportation access to nearly 6,000 vehicles a day - and that was at a reduced weight limit. Projections for the year 2000 are 18,000 vehicles. Loss of this vital transportation link will have an immediately devastating affect on the economic growth of the community. Already one rather shaky business on the east side of the canal has closed its doors. Two more anticipate closing within the month.

Without this bridge, all of this traffic is being diverted over the only two alternate routes available. Both of these are also bridges. Traffic delays of over one hour are common. Traffic accidents have already began to increase. There are three railroad lines intersecting highways in this area. Our response to railroad and refinery accidents is of primary concern to use.

Closure of the bridge, with no input from the community has affected the manner in which we are able to provide for the health, safety and welfare of our residents. It impacts the economic development of the entire northern portion of Will County.

If the Village had the bonding capacity, and a way to pay the debt, we would build this bridge ourselves. We can't issue bonds under current laws sufficient to finance an undertaking of this magnitude. Surrounding municipalities, dealing with increased traffic patterns as a result of this closure, agree with the need for a replacement, but none are reaching into their wallets either.

The Metropolitan Water Reclamation District has an elected board, but none of its constituents are in Will County. Where is help going to come from? What do we tell the 6,000 voters that once used this bridge daily?

I'm sure you will find similar situations all across our country. Infrastructure replacement is something that has been put on the back burner far too long in most communities. These big ticket projects cost more money than most communities ever hope to raise locally. Property taxes already representing an increasing burden are not available for a non-home rule community in a situation such as ours. Responsibility is not clearly defined. Apparently, need does not stand alone as justification.

If it were mandatory that every capital improvement carries the burden of a replacement financing built into its creation, future infrastructure might be protected. Communities of today have an obligation to participate in capital planning and financing plans. "Pay as you go" is no longer enough - we must look at "paying before you go". The burden of replacing what we already enjoy is ours, but we need help. It is critical that a plan be developed and enacted to provide relief to communities like Romeoville struggling at the grass roots level to provide day to day services that your constituents have come to expect. We must look at a new era of fiscal management. We must inventory and plan. Unfortunately for Romeoville, we have done all these things - but are bearing the affects of another agency which did not.

The House Committee
on Public Works and Transportation
Remarks by Laura A. Jibben
Executive Director
Regional Transportation Authority
Matteson, Illinois
October 29, 1990

Presented By: Vincent Petrini

I welcome the opportunity to appear before the House Committee on Public Works and Transportation. As the Executive Director of the Regional Transportation Authority (RTA), I would like to relate to you the far-reaching capital needs of a system as large as ours. I also hope to update you on our 1989 Capital Improvement program and the reasons why consistent federal support is so crucial to our efforts.

Before I describe the RTA's view of infrastructure needs in our area, I do want to thank the Committee on Public Works and Transportation for all it has already done to build and rebuild our highways, roads, bridges and transit systems. Your Committee wrote the legislation which built the interstate highway network. You led the fight to gain federal aid for mass transit. You created and stood behind a comprehensive program to rebuild bridges carrying highways and railroads. The fact that you are holding this hearing shows us that you are continuing that history of seeking ways to be part of the solution to our infrastructure problems.

The issues that I would like to talk about today have a real and immediate impact on the entire RTA region. In Chicago and its suburbs, we are faced with an enormous challenge. It is a challenge that involves billions of dollars worth of reinvestment in our rail lines, buses, stations and bridges. But, it is a challenge we can not and will not let go ignored.

Let me begin by giving you a brief background on the size, scope and age of our system. Consider the fact that mass transit in Northeastern Illinois carries 2.5 million people to work every business day, and supplies 980 million annual trips. In the RTA system there are 1,200 rapid transit cars and 950 commuter rail cars. There are 1,400 miles of track and 100-year-old bridges. There are 3,000 buses and nearly 500 Metra and CTA stations.

The facts themselves present a compelling case. More than 400 Metra bridges have been in service longer than 80 years and more than half of Metra's stations are nearly 50 years-old. CTA maintenance facilities are in desperate need of renovation. Maintenance garages which service 700 CTA buses were built before 1910 and they were designed to service streetcars, not today's 14-ton buses.

Those numbers, of course, are simple trivia until it comes time to repair these rapidly deteriorating assets. Then those numbers become real. As an example, the Chicago Transit Authority (CTA), one of the three operating boards under the jurisdiction of the RTA, maintains a fleet of buses that average more than 12-years of age. The oldest bus at the CTA is 21-years-old and carries in excess of 600,000 miles. At a hearing of the Illinois Pollution Control Board, the CTA acknowledged that over the course of its service that one bus left a smoky, diesel trail long enough to travel around the world 40 times. The bus will be replaced.

Such statistics are startling. But they speak to the need. By 1992, the CTA plans to buy 961 buses to begin replacing their aging fleet. But those type of purchases are becoming increasingly expensive. In 1986, the RTA issued a Strategic Plan to address this problem. According to that plan, meeting the overal need of the RTA system, which includes the CTA; Metra, the commuter rail line; and Pace, the suburban bus system; has been estimated at $6 billion in 1987 dollars. In current dollars, that need now exceeds $8 billion. That would simply get the RTA system back to a standard of safety and efficiency that we all must insist upon.

With more than $15 billion in assets, we oversee the second largest transit system in the nation and one of the oldest. Ninety-nine percent of the CTA's elevated structures are more than 75-years-old. Some stations were built before the turn of the century. We have had to conduct engineering studies to determine the type of steel that was used to construct these mammoth structures. And, every day millions of people must depend on this system.

We must overcome the reluctance to provide vital funding to these kinds of capital projects. We must reinvest in our existing transit system now for we have put off making these improvements for too long.

Today, we rebuild expressways and highways every 15-20 years. Yet, CTA, Metra and Pace jointly provide more than 60 percent of the total trips to the Chicago Loop for suburban Cook County. Every day the CTA transports one-quarter of a million people from the suburbs. Without it, there would be an additional 175,000 cars on our already clogged roads and expressways.

In 1989, we took a local step in the right direction by successfully lobbying the Illinois General Assembly to raise our bonding authority to $1 billion and to provide the financial resources to back the sale of those bonds. The implementation of this program has become the top priority of the RTA.

In May of this year, after negotiating the manner in which funds would be dispersed to the service boards and after extensive meetings with financial rating agencies, the RTA issued its first $100 million of debt. The RTA was granted a AAA bond rating, ensuring that the cost to taxpayers will be minimized.

The first $100 million of the capital program has been dedicated to upgrading the RTA's rolling stock, the system's most apparent need. Proceeds of the first bond sale will be used to purchase 30 new locomotives for Metra and 200 new CTA buses.

The RTA understands that the federal government cannot afford to fund 80 percent of the cost of mass transit projects as it has in the past. That is why we turned to local and state funding sources to make up a majority of the resources for our recent captial program. But, even with this strong local source of funding, the federal government must continue to be financial partners with us in rebuilding Chicago's transit system.

While we are attempting to cope with dwindling federal resources by increasing our local resources, we must be able to rely on continuing support from Washington. The sporadic needs of other transit agencies cannot become the problem of Northeastern Illinois in competing for federal funds for long-term infrastructure replacement. While we recognize the need for increased local support, we need to be able to rely on a stable stream of federal dollars to support us as we now begin to retire long-term debt.

Through a strong mix of federal, state and local resources, we have undertaken the largest capital renovation program in our agency's history and we are just beginning to see our labor paying off.

Engineering studies are currently underway to assess the condition of the CTA rapid transit lines. Stations like that at Harlem Avenue on the Congress-O'Hare line are experiencing total rehabilitation providing a safer atmosphere for our riders. We are planning to rebuild major commuter rail stations. We are making progress and will continue to do so as long as we can depend on your sustained support.

So that we may follow through in our efforts to make our transit system safe, affordable and dependable, we must be able to find a balance. The threat of lost federal dollars will place us in a position that could endanger our entire program. Here, in Northeastern Illinois, we have heard the messages from Washington about overmatching of funds and increased local support and we have heeded those words. Now, more than ever, we cannot afford to have our federal partner abandon us as we begin to implement the programs our system so desperately needs.

I would like to thank you once again for the opportunity to provide this testimony before your Committee. We at the RTA are looking forward to working with you, the members of the Committee on challenges related to infrastructure in the RTA region in the future.

U.S. HOUSE OF REPRESENTATIVES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

on the issue of

PROGRAM FOR REBUILDING THE NATION'S INFRASTRUCTURE

by

BARBARA F. SLOAN

on behalf of

SOUTH SUBURBAN MAYORS AND MANAGERS ASSOCIATION

Matteson, Illinois

October 29, 1990

CHICAGO SOUTHLAND
1154 Ridge Road, Suite 100 • Homewood, Illinois 60430 • (708) 957-6970

My name is Barbara Sloan and I am representing South Suburban Mayors and Managers Association. Our Association is a multi-municipal organisation representing thirty-nine municipalities in Southern Cook and Eastern Will Counties. As such, the Metropolitan Planning Organisation for Northeastern Illinois has designated our Association the Regional Council for this area, responsible for the review, evaluation and recommendations regarding transportation projects of all modes in the Southern Suburbs of the Chicago Region.

I am pleased to have the opportunity to testify at this hearing of the Committee on Public Works and Transportation regarding the rebuilding of infrastructure in our nation. The Transportation Committee of South Suburban Mayors and Managers Association is particularly interested in the new surface transportation legislation and has been active in following its progress through our involvement with the Chicago Area Transportation Study. On behalf of the Transportation Committee, I wish to convey to you some of the issues which concern our Association regarding the upcoming legislation.

Since the mid-1950's, the major focus of surface transportation in the United States has been the interstate highway system. With that system very near completion, it is time to redirect our focus toward a transportation problem of a somewhat different nature: mobility in our urban areas. If left unaddressed, the problem of urban congestion may reach proportions which could bring our major metropolitan areas to a crawl, thus threatening our national economic vitality. The new Surface Transportation Legislation should be directed toward the solution of this problem. An increased proportion of Federal funding should be provided to our nation's urban areas for the purpose of relieving this congestion.

In regard to the Federal-Aid Urban Highway Program, our Association is very supportive of the continuation of this concept in the new legislation. This program has been extremely successful in the South Suburbs as it has been in the entire Chicago region since its inception. We strongly encourage the continuation of this program, or one very similar to it, in which local elected officials have the ability to select and program highway projects on a designated system of roadways which includes those under local jurisdiction. Through this mechanism, priority funding may be identified at the local level in the context of regional planning. Local government is assured a role in maintaining and developing the urban transportation infrastructure. As is currently the case, the Program should continue to function as a pass through process in which a portion of Federal dollars goes directly to the local level. A maximum Federal share of the funding split should be specified, but with an overmatch provision as in current legislation.

Finally, there is certainly no Public Works/Transportation issue more vital to the Chicago Metropolitan Regional area, including Northeastern Illinois and Northwestern Indiana, than the construction of a supplemental commercial airport. Due to the fact that the Chicago region is such a critical center of air traffic for the entire nation, the successful development of a supplemental airport in the shortest time possible is also important to the nation as a whole.

We certainly appreciate the support of the members of this committee for the ongoing Bi-State study process which began one year ago and which is scheduled to be completed next October. It is our expectation that the conclusion of the site selection phase of this process will produce the best site for the region as a whole.

The consulting team, in cooperation with the states of Illinois and Indiana, the City of Chicago, the FAA and the other Federal, State, and local agencies, are made up of extremely qualified experts. We believe that if the technical process remains fair, and in compliance with all laws and regulations with a minimum amount of partisan politics and sub-regional parochialism, the best site will emerge.

We ask your assistance and that of the entire Congress to help our region accomplish those goals.

1. We request your continued interest in the process assuring that it remains a technically fair one.
2. We request continued funding for the site selection and Master Plan phases of the process.
3. Once the region and the FAA come to a consensus on the preferred site, we request adequate federal assistance to commence land acquisition, airport construction funds, and funds to build the necessary highway and mass transit infrastructure to support this new airport.

Together we have a unique opportunity to construct an airport for the 21st century, to serve the greater Chicago metropolitan region and indeed, to serve the nation.

On behalf of the Transportation Committee and the entire membership of South Suburban Mayors and Managers Association, I wish to emphasize the importance of the above items being addressed in any upcoming transportation legislation. We at the local level are depending on the sound judgment of your committee to create a new transportation program which will enable our nation to retain its economic prominence through an efficient and well maintained transportation network.

BUSSE, Mayor, City of McHenry BARBARA KEY, President, Village of Lake in the Hills DONALD L. RANDICH, Mayor, City of Crest Hill

MR. CHAIRMAN AND MEMBERS OF THE COMMITTEE, THANK YOU FOR GIVING ME THE OPPORTUNITY TO TESTIFY ON THE REBUILDING OF OUR NATION'S INFRASTRUCTURE. I AM DENNIS VALY, MAYOR OF NEW LENOX, A TOWN OF 10,000 LOCATED 35 MILES SOUTHWEST OF DOWNTOWN CHICAGO. THE MORE THAN 260 MUNICIPALITIES OUTSIDE OF CHICAGO IN NORTHEASTERN ILLINOIS PARTICIPATE IN TRANSPORTATION PLANNING THROUGH ELEVEN REGIONAL COUNCILS OF MAYORS. I AM CHAIRMAN OF THE EXECUTIVE COMMITTEE OF THESE COUNCILS AND AM TESTIFYING ON THEIR BEHALF TODAY. THE EXECUTIVE COMMITTEE AND THE COUNCILS HAVE SPENT A CONSIDERABLE AMOUNT OF TIME AND ENERGY OVER THE PAST TWO YEARS ON IDENTIFYING OUR INFRASTRUCTURE NEEDS AND WORKING TOWARDS A STRATEGY FOR MEETING THESE NEEDS. WE HAVE COME TO THE CONCLUSION THAT A CRISIS IS IN THE MAKING AND HAVE FORMULATED IDEAS ON HOW TO AVERT THIS CRISIS.

FIRST AND FOREMOST, THE MAYORS SUPPORT A SUBSTANTIAL ROLE FOR THE FEDERAL GOVERNMENT IN URBAN MOBILITY. WE ARE UNITED IN OUR SUPPORT FOR CONTINUATION OF THE FEDERAL AID URBAN PROGRAM OR A PROGRAM VERY SIMILAR TO IT. THIS PROGRAM HAS DONE THE JOB IT WAS INTENDED FOR IN OUR REGION: THE SUCCESS OF REGIONAL PLANNING AND DECISION MAKING AND THE NEAR TOTAL EXPENDITURE OF THE FUNDS ON PROJECTS TO INCREASE THE MOBILITY BETWEEN URBAN COMMUNITIES ARE EVIDENCE OF A GOOD PROGRAM. THE REAUTHORIZATION MUST INCLUDE A PROGRAM WHICH DELIVERS FEDERAL FUNDS DIRECTLY TO LOCAL PROJECTS WITHIN METROPOLITAN AREAS. FOR THE LOCAL ELECTED OFFICIALS, THE RESPONSIBILITY FOR SELECTING AND PROGRAMMING THE PROJECTS FUNDED THROUGH THIS PROGRAM IS OF PARAMOUNT IMPORTANCE SINCE WE ARE THE ONES MOST FAMILIAR WITH THE NEEDS.

THE FOCUS OF THE FUTURE FEDERAL PROGRAM SHOULD BE ON URBAN AREAS TO RETAIN MOBILITY: URBAN MOBILITY IS A NATIONAL CONCERN BECAUSE OUR NATIONAL ECONOMIC VITALITY IS DEPENDENT ON IT.

A SEPARATE FORMULA DRIVEN PROGRAM IS ESSENTIAL FOR URBAN AREAS TO ALLOW FOR CONTINUED EFFORTS TO IMPLEMENT SOLUTIONS TO INTRA-URBAN TRAVEL. PROGRAMS NEED TO HAVE UNIFORM MATCHING PROVISIONS, SO THAT NO LOCAL DECISION MAKING IS DRIVEN BY A PROJECT'S ABILITY TO ATTRACT THE GREATEST FEDERAL PARTICIPATION. THE NEW PROGRAM MUST BE FLEXIBLE—FLEXIBLE IN SUCH A WAY AS TO MEET THE VARYING NEEDS OF DIFFERENT SUBREGIONS WITHIN A METROPOLITAN AREA. THE ABILITY OF THE LOCALS TO OVERMATCH FEDERAL FUNDS IS CRITICAL. IN AREAS THAT HAVE THIS ABILITY, OVERMATCHING ENABLES FEDERAL DOLLARS TO GO FURTHER. THIS OPTION SHOULD BE RETAINED IN FUTURE PROGRAMS.

ANOTHER AREA OF FLEXIBILITY THAT IS OF PARTICULAR IMPORTANCE TO NORTHEASTERN ILLINOIS IS THE ABILITY TO COMINGLE FEDERAL AND PRIVATE FUNDS. AUGMENTING FEDERAL DOLLARS WITH TOLLS, DEVELOPMENT FEES AND IMPACT ASSESSMENTS ALLOW MANY MORE PROJECTS TO BE ACCOMPLISHED WITH FEDERAL DOLLARS THAN OTHERWISE. THE MUNICIPALITIES HAVE WORKED LONG AND HARD TO ENCOURAGE PARTICIPATION BY THE PRIVATE SECTOR IN THE BUILDING AND REBUILDING OF INFRASTRUCTURE. THE STATE LAST YEAR WAS SUCCESSFUL IN PASSING A 6¢ INCREASE IN THE STATE GASOLINE TAX. THE FEDERAL GOVERNMENT MUST SHOW AN EQUAL WILLINGNESS TO SHARE THE LOAD IN ORDER TO FOSTER A HEALTHY ECONOMY. RECENT STUDIES, INCLUDING ONE BY APOGEE RESEARCH, INC., HAVE ILLUSTRATED THE CONNECTION BETWEEN A SOLID INVESTMENT IN INFRASTRUCTURE AND THE COUNTRY'S GNP.

THE AMERICAN PUBLIC IS BEING DECEIVED ON THE MATTER OF USER FEES FOR TRANSPORTATION. AS YOU WELL KNOW, A PORTION OF THESE FUNDS ARE BEING HELD HOSTAGE TO DEFICIT REDUCTION. THIS IS A TOTAL DECEPTION: USER FEES ARE ONLY APPROPRIATE WHEN THEY ARE USED FOR THE PURPOSES FOR WHICH THEY ARE COLLECTED. MONDAY'S HEADLINES ANNOUNCED A BUDGET AGREEMENT THAT INCLUDES A HIKE IN THE GASOLINE TAX FOR DEFICIT REDUCTION. THIS IS A BAD PRECEDENT. ANY INCREASE IN THE FEDERAL MFT SHOULD BE FOR TRANSPORTATION PURPOSES. WAS THERE ANY ATTEMPT ON THE PART OF THIS COMMITTEE TO ASSURE THAT FUNDING FOR OUR PROVEN TRANSPORTATION NEEDS WAS PART OF THIS PACKAGE? ACCORDING TO THE APOGEE STUDY, A SUSTAINED $40 BILLION FEDERAL HIGHWAY PROGRAM COULD GENERATE AN ADDITIONAL $400 BILLION IN GNP AND $29 BILLION IN CORPORATE PROFITS ANNUALLY BY 2012.

THE USDOT'S OWN REPORTS SHOW A TREMENDOUS NEED FOR INVESTMENT IN ORDER TO STAVE OFF FUTURE SUBSTANTIAL INCREASES IN THE COST TO REBUILD INFRASTRUCTURE. A 1989 REPORT TO CONGRESS BY USDOT IDENTIFIED 40% OF THE PAVEMENT ON THE FEDERAL SYSTEM AS IN POOR OR FAIR CONDITION AND 28% OF THE BRIDGES AS STRUCTURALLY DEFICIENT OR FUNCTIONALLY OBSOLETE. CONDITIONS IN NORTHEASTERN ILLINOIS PARALLEL NATIONAL NEEEDS. THE USDOT SAID A 20-YEAR, $40 BILLION ANNUAL INVESTMENT WOULD BE NECESSARY TO MEET EXISTING HIGHWAY CAPITAL NEEDS. THAT WOULD BE $25 BILLION ABOVE THE CURRENT ANNUAL FEDERAL HIGHWAY SPENDING. FEDERAL FUNDS MUST BE PART OF THE MIX THAT REBUILDS OUR TRANSPORTATON SYSTEMS.

TO SUM UP OUR RECOMMENDATIONS ON REBUILDING OUR GROUND TRANSPORTATION INFRASTRUCTURE: WE NEED A PROGRAM THAT IS FLEXIBLE, FORMULA DRIVEN AND RETAINS THE ABILITY OF THE LOCAL ELECTED OFFICIALS TO SELECT AND PROGRAM PROJECTS. IN ADDITION, THE FUNDING FOR THE FEDERAL AID URBAN OR SIMILAR PROGRAM MUST BE INCREASED. THE FEDERAL FUNDING FOR THIS PROGRAM STAYED THE SAME FOR OVER A DECADE, EVEN AFTER THE FEDERAL MOTOR FUEL TAX INCREASE IN 1983. IN THE LAST ACT, THE FUNDING FOR THE FAU PROGRAM DECREASED.

FINALLY, LET ME TURN MY ATTENTION TO AIRPORTS. THE COUNCIL OF MAYORS HAS BEEN AN ACTIVE PARTICIPANTS IN THE ONGOING CONSIDERATION OF A SUPPLEMENTAL AIRPORT FOR OUR REGION. AS YOU ARE AWARE, ILLINOIS AND INDIANA ARE CURRENTLY UNDERTAKING A STUDY TO DETERMINE THE LOCATION OF A SUPPLEMENTAL AIRPORT FOR OUR REGION. WE NEED SUFFICIENT AIRPORT CAPACITY TO KEEP UP WITH RISING DEMAND. IT IS IN THE ECONOMIC INTEREST OF OUR AREA TO DO SO. FROM A NATIONAL PERSPECTIVE, ADDITIONAL COMMERCIAL AIRPORT CAPACITY IS NEEDED, ESPECIALLY IN A STRATEGIC AREA SUCH AS THE CHICAGO REGION. A BISTATE STUDY CONCLUDED THAT ADDITIONAL AIRPORT CAPACITY WILL BE NEEDED IN THE NEAR FUTURE. THE FEDERAL GOVERNMENT SHOULD BE A MAJOR SOURCE OF FINANCING FOR DEVELOPING THIS ADDITIONAL CAPACITY.

THIS CONCLUDES MY TESTIMONY. AS YOU HEAD BACK TO WASHINGTON AND CONTINUE TO WORK ON BALANCING THE DEMANDS FOR INCREASED TRANSPORTATION FUNDING WITH THE VERY REAL NEED OF REDUCING THE DEFICIT, PLEASE REMEMBER THE LINK BETWEEN INVESTMENT IN OUR NATION'S INFRASTRUCTURE AND OUR NATIONAL PROSPERITY.

AGAIN, THANK YOU FOR ALLOWING ME THE OPPORTUNITY TO PRESENT THE CONCERNS AND IDEAS OF THE COUNCIL OF MAYORS.

VILLAGE OF PLAINFIELD
WILL COUNTY'S OLDEST COMMUNITY

October 2, 1990

Representative George E. Sangmeister
1607 Longworth House Office Building
Washington, D.C. 20008

Dear Representative Sangmeister:

Thank you for the opportunity to provide testimony before the U.S. House Committee on Public Works and Transportation. Deterioration of public infrastructure is a serious concern which must be addressed at all levels of government. Only through a concerted effort can progress be made in rebuilding and maintaining existing public infrastructure upon which we will depend.

To best explain the conditions of local infrastructure in Plainfield, allow me to provide a brief background of our community. The Village of Plainfield, Illinois is Will County's oldest community. Established in 1829 Plainfield pre-dates the formation of the County in which it resides. The neighborhoods of the central core area of the Village are filled with historic churches, homes and businesses. Transportation systems such as the Elgin, Joliet and Eastern Railroad, the Lincoln Highway (one of this country's first transcontinental highways) and U.S. Route 66 helped spur development.

Today, Plainfield is a rapidly growing community of about 5,000 people. New residential subdivisions are being developed to the north, south, east and west. Road systems such as Illinois Routes 59 and 126, U.S. Route 30 and Interstate 55 serve our community. The E.J.&E. Railroad continues to provide rail services via two lines through the Village.

In a Village such as Plainfield, financial resources are limited. While private funds (by developers) provide capital to install infrastructure in new subdivision developments, local funding is required for maintenance and repair of all systems. Costs are also incurred when updating infrastructure to meet ever increasing state and federal regulations for water quality and environmental protection.

400 NORTH DIVISION STREET • PLAINFIELD, ILLINOIS 60544 • (815) 436-7093

Representative George E. Sangmeister
October 2, 1990
Page Two

As a result of Plainfield's mixture of old and new development, local infrastructure has a broad range of needs. Older neighborhoods are still served with 2" and 4" water mains, water towers are aging and are in need of major maintenance procedures. Some combined sanitary and storm sewer lines are still in operation. Problems resulting from storm water inflow and infiltration must be resolved. Several local streets are without curbs and gutters and storm sewer systems. In some areas, streets are narrow having been built prior to modern transportation methods.'

The E.J.&E. railway viaduct over Illinois Route 59 is dangerously narrow making it difficult for two trucks to pass in opposite directions. The viaduct also experiences flooding during heavy rains. Funding has not been available for the needed improvements. Route 59 is a major regional highway serving over 20,000 vehicle daily.

Plainfield is not alone in its need for infrastructure upgrades. The burden on local government is too great to bear alone. For this reason, assistance from Federal and State levels is required to meet our community needs.

Thank you for this opportunity to express the concerns of my community on this important issue.

Sincerely,

Mary T. Latta

Mary T. Latta
Village President

SUBMISSION FOR THE RECORD FROM GORDON McCLUSKEY

Joliet/Will County Center for Economic Development
Two Rialto Square, 116 N. Chicago Street, Joliet, IL 60431 • (815) 723-1800 • FAX (815) 723-6972

TRANSPORTATION COMMITTEE RECOMMENDATIONS FOR REGIONAL WILL COUNTY TRANSPORTATION PROJECTS

These projects are transportation projects that would regionally benefit Will County and are not listed in any priority order.

- An interchange at Houbolt and Interstate 80.
- Widening and signalization of Route 53 from Ruby Street in the City of Joliet to Joliet Road (I-55) including high level bridge at Ruby Street in the City of Joliet.
- Construction of a high level bridge connecting Caton Farm Road and Bruce Road.
- Widening and signalization of Route 59 from I-55 to the Will/DuPage County line.
- Construction of Federal Aid Primary 431 from Interstate 55 to Interstate 80.
- Third Airport.
- Fox Valley Freeway.
- South Suburban Expressway.
- Mass Transportation Regional Network.
- Widening and signalization of Route 30 from I-80 to Will County-Cook County Line.
- Interchange on I-57 at Stunkel Road.

7-31-90

1830

City of Lockport
Central Square

October 3, 1990

Representative George E. Sangmeister
1607 Longworth House Office Building
Washington, D.C. 20008

Dear Representative Sangmeister:

In response to your correspondence dated September 6, 1990 indicating a local meeting of the U. S. House Committee and offering an opportunity for both oral and written testimony, the Lockport City Council has requested that the following infrastructure needs of our community and/or the area be provided.

Exhibit A, which is supported by council action on October 1, 1990, is the Will County Transportation needs in an unprioritized order

Exhibit B is Lockport's Transportation Short and Long-Term Goals.

In particular, one of our Transportation Long-Term Goals-the High Level Bridge at Bruce-Caton Farm Rd is now a top priority. With the recent unannounced closing of the 135th Street (Romeo Rd) bridge and the prior closing of the Divisions Street bridge, all traffic is now rerouted through Lockport. At peak times east of the 9th St.high level bridge we have grid lock on Rt 7 in Lockport east to Lincoln Street and on the west on Rt 53 north to Lewis university.

We need another high level bridge. We feel the location at Bruce-Caton Farm Rd for the next high level bridge offers a greater area wide benefit in that it could connect with the south leg of I-355 (Lake-Will Tollway) to Illinois Route 171,53,30,55,59 and westerly to 47 and 71 to become a local east west interconnect between 80 and 88.

Both of these Exhibits confirm our need for continued Federal support and continued funding through the Highway Act and funding for the local Joliet Urbanized Council of Mayors.

222 E. Ninth Street, Suite 4, Lockport, Illinois 60441-3497
Phone (815) 838-0549 Fax: (815) 838-9498

Exhibit C is a copy of correspondence to Ill. Legislators Wennlund and Dunn which further illustrate the type of infrastructure needs of the city including storms sewers installation, sanitary sewer improvements, emergency alert sirens, public works equipment and local health programs.

Two of these items are highlighted by the recent Plainfield/Joliet tornado and lack of notice and the very wet summer which produced a bumper crop of mosquitos. It is my understanding that had the Doppler radar been available we might have had a more formal notice that the actual touchdown. Such an installation is proposed at the expanded Lewis University airport project by the Joliet Port Authority.

We would like the designation of a Federal Disaster Area to include or initiate further action on the moving of the weather station from Marseilles to Lewis University.

There other condition that the City of Lockport needs:

Historic downtown improvements and revitalization.

Illinois and Michigan Canal improvements including dredging, maintenance, and established water flow to promote tourism in the National Corridor.

Enterprise Zone opportunities offered with tax abatements that are not spread over the existing population.

Regrettably time does not allow further oral comments at this time.

The Lockport City Council and our citizens thank Chairman Anderson,the Committee and you George for this opportunity to make our public statement.

Very truly yours

Robert A. Wynveen
Mayor

Municipal/Transportation Needs

Dear Gordon:

In accordance with your request, we have listed below Short-Range Goals (within 5 years) and Long-Range Goals (within 10 years) of possible transportation needs. While the request is for municipal needs, we feel that the list should include major improvements likely to be required in the Lockport area regardless of the present Municipal Boundaries.

SHORT-TERM GOALS:

1. Completion of the Farrel Road FAUS project from Illinois Route 7 to Division with an extension south to Bruce Road and north to Illinois Route 171.
2. Improve Gougar Road from Division to Bruce, and Bruce from Gougar to Farrel Road.
3. Improve intersection of Illinois Route 171 with Illinois Route 7.
4. Complete planned improvement of Illinois Route 171 from Illinois Route 83 to Joliet.
5. Complete planned improvement of Illinois Route 53 from I-55 to Joliet.

CONSOER
TOWNSEND
&
ASSOCIATES

Mr. Gordon McCluskey
City of Lockport
Lockport, Illinois
May 1, 1990
Page 2

LONG-TERM GOALS:

1. Improve Bruce Road from Farrel Road to Illinois Route 53 across the Des Plaines with a new high level bridge. Extend east to Oak Lawn.
2. Build FAP-431 as a freeway or toll road from I-55 to I-80 including an interchange at Bruce Road.
3. Widen Illinois Route 7 to four lanes from Illinois Route 53 to Oak Lawn.
4. Develop Gougar Road to arterial standards from Route 171 and State Street to south of I-80.
5. Develop Cedar Road to arterial standards from 143rd Street to U.S. 30.

If you need additional information, please contact us.

Vary truly yours,

April 24, 1990

Mr. Larry Wennlund
State Representative·84th District
1234 N. Cedar Road
New Lenox, Illinois 60451

Dear Mr. Wennlund:

This letter is in response to legislative inquiries as to how the City of Lockport is spending funds received as a result of the temporary two year state income tax increase.

Receipts from the first allotment received in August 1989 through March of 1990 total $130,695.59. This money along with future receipts has been expended or obligated for projects and equipment purchases that we feel meet the intent of this revenue source. Following is a summary of these projects and equipment:

1. Sanitary Sewer and Water-North Madison. This area has been without these city services, yet have been paying taxes to retire debt service funding the primary sewerage treatment plant in 1958, secondary treatment in 1969, and advanced treatment in 1988. Currently no city water is being provided to these residents. Total project cost $280,000.00.

2. South End Storm Sewer-To construct storm sewers that will provide drainage and alleviate serious flooding in the south end of Lockport. Project cost is $315,000.00.

3. Purchase of Emergency Alert Sirens-the city has embarked on a large scale program to provide enhanced emergency warning to all citizens. Initially we replaced our only siren, donated to us by Commonwealth Edison in the 1950's. Recently we purchased two (2) additional sirens to provide coverage to areas not previously adequately covered. Two additional sirens will be purchased to insure complete coverage of our emergency warning system. Total project cost $65,000.00.

4. Replacement of major Public Works equipment, such as a new backhoe, salt truck and spreader, and various other equipment, allowing additional safety for employees and more efficient and timely city services.

5. Mosquito, Nuisance and Encephalitis Control Program-The Asian Tiger mosquito, an aggressive biter and notorious disease carrier, has established itself in Northern Illinois. The wet spring will likely produce a large population of the insects. Total project $15,000.00 per year cost.

6. Improvements to our Railroad Crossing Warning System - $20,000.

The surcharge revenues have been or will be used for projects and equipment that will enhance our ability to provide for a better and safer quality of life for our citizens. None of these funds will be used for normal operating costs.

Further, we are concerned that pending legislation such as SB 225 - DeAngelis may eliminate allocations to municipalities.if the surcharge becomes permanent. The City of Lockport strongly supports the continuance of the 2% State Income Tax surcharge to enable us to continue to provide vital services to the citizens of our community.

Very truly yours,

Robert Wynveen
Mayor - City of Lockport

Subject: High Level Vehicular Bridge
in Lockport Township
Feasibility Study and Report

Dear Mr. Piazza:

We are pleased to transmit twenty five (25) copies of the report on the Feasibility Study for a new high level vehicular bridge in Lockport Township. It has been a pleasure to work on this important project for the Township. We are confident that the information developed in this report will facilitate future transportation planning for the entire area.

If you should have any questions pertaining to the study, or the findings documented in this report, please contact us.

Very truly yours,

CONSOER, TOWNSEND & ASSOCIATES, INC.

FEASIBILITY STUDY FOR A NEW HIGH LEVEL BRIDGE
OVER THE DES PLAINES RIVER/CHICAGO SANITARY AND SHIP CANAL
IN LOCKPORT TOWNSHIP, ILLINOIS

TABLE OF CONTENTS

PAGE

LETTER OF TRANSMITTAL

I. INTRODUCTION 1

II. NEED FOR IMPROVEMENT 2

III. EXISTING CONDITIONS 4

IV. ALTERNATIVES 8

V. RECOMMENDATIONS 14

I. INTRODUCTION

This report identifies alternative locations for a new high level vehicular bridge over the Des Plaines River/Chicago Sanitary and Ship Canal in Lockport Township. Various alternatives are reviewed to consider the feasibility of each and to recommend the location which appears most promising. The option of widening the existing high level bridge in lieu of constructing a new high level crossing is also addressed.

The western Will County area is traversed by the Des Plaines River valley, with its inherent restrictions on vehicular movements across it. In Lockport Township, the river valley runs north-south, with relatively equal parts of the Township on each side of the river. There is one high level bridge at Illinois Route 7, near the geographic center of the Township. The only other crossing is the system of structures for 135th Street, along the northern boundary of Lockport Township.

Local officials of Lockport Township, Lockport and Crest Hill have recognized the impact which vehicular river crossings have upon many aspects of their governmental responsibilities. They are aware that there will be future traffic benefits and demands generated by the proposed construction of FAP 431 and the improvement of Weber Road. This study and report provides technical documentation for both the assessment of need and the feasibility of location for improved river crossing capacity in Lockport Township.

The study area is the Des Plaines River valley in Lockport Township, between Illinois Route 53 on the west, Illinois Route 171 on the east, and the entire north-south limits of the Township (135th Street on the north and Theodore Street/Rosalind Street on the south). The study will also note those conditions beyond these limits which affect the study area.

The following report was developed utilizing information contained in the Will County Highway Study Recommended Long-Range, Major Improvement Program, prepared in 1984, as well as current aerial photography, property maps, and traffic maps prepared by the Illinois Department of Transportation. In addition, background information was obtained through discussions with staff members of the Will County Planning Department, and the Illinois Department of Transportation.

II. NEED FOR IMPROVEMENT

Officials of Lockport Township have initiated this study in response to their need to address transportation planning for the future of the area. Other studies have identified the need for improved access across the river valley. These past transportation studies have concluded that there is a need for additional high level crossings in the study area. The Joliet Area Transportation Study of 1969 recommended two additional high level bridge crossings under "Transportation Needs of 1985", at the Caton Farm Road/Bruce Road corridor, and at the then proposed Fox Valley Freeway. The freeway plan has since been abandoned.

Review of the distribution of existing population shows greater concentration in the south part of the Township, south of 159th Street. Capacity improvements north of this area will serve to reduce demand at the existing river crossings, but with diminishing effect. However, as corridors closer to Romeoville are considered, the demand increases again. With anticipated future development both east and west of the river valley, river crossing demand is likely to become more evenly distributed. Therefore, evaluation of the full length of the river valley within the Township is appropriate.

The 1984 Will County Long-Range Highway Plan identified increased traffic capacity across the river valley as being critical to the County's future needs. That report recommended widening the 135th Street bridge over the Des Plaines River to four lanes, and construction of a new high level bridge over the Sanitary and Ship Canal and the Santa Fe tracks. This 1984 report used the entire county as its study area, and identified 135th Street improvements as having the potential to fit a long-range concept to improve 135th Street across the entire county.

Transportation planning studies, roadway improvements and land use developments have continued since the 1984 Will County study. Those with particular importance to this feasibility study include IDOT's project study for FAP 431, Will County's improvements to Weber Road and IDOT's study for a new high level bridge in Joliet at Ruby Street (Illinois Route 53). The first two of these increase the potential for demand of east-west vehicular movements.

Weber Road has been improved by the County to a four lane arterial roadway. County and municipal officials hope to include a Weber Road interchange on Interstate 55 among future improvements. The existing upgraded roadway, and the potential interchange, combined with land use trends along this north-south corridor, represent potential for further development. This would result in an increase in demand for east-west movements across the river valley.

FAP 431 is an extension of the North-South Tollway's alignment, from I-55 at the north to I-80 at the south. It is under study and recommendations for project alignment and interchange locations are not final. However, the corridor, as presented in the first public information meeting, is immediately east of Lockport Township in Homer Township, west of Gougar Road. The tentative interchange locations are essentially the same as the original proposal, and include 127th Street, Illinois Route 7/159th Street, Bruce Road and Illinois Route 6. Public input was obtained at the meeting and IDOT has begun preliminary technical review. The construction of FAP 431, with interchanges at these locations would create a strong potential for development in this area.

The County planning staff has indicated that it would be desirable to upgrade Gougar Road as a north-south arterial street, in the same corridor as FAP 431. This interest is independent of the FAP 431 project, since it would serve residential and other development in Homer Township.

The study area is the link between these north-south corridors of both existing development and future development potential. Future development on both sides of the study area will increase the demand for east-west movements across the river valley. Under the present conditions, there is peak hour traffic congestion at the Illinois Route 7 bridge which backs up in all directions from the intersection of Illinois Route 7 and Illinois Route 171. Queues extend well onto the existing high level bridge. The existing traffic congestion at Illinois Route 7, the limited number of existing east-west crossing locations, and the projected increase in demand for east-west movement across the river valley, highlight the need for improved river crossing capacity.

III. EXISTING CONDITIONS

Topographic Features

The river valley contains a dense north-south linear system of waterways, railroads and roadways. All of these features must be considered in reviewing existing conditions and subsequently in analysis of locations for crossing improvements.

The parallel waterways include, from west to east, the Des Plaines River, the Chicago Sanitary and Ship Canal, Long Run Creek (through most of the study area), and the Illinois and Michigan Canal (I & M Canal). See Exhibit 1. The Des Plaines River is immediately west of the shipping canal and is broad and relatively shallow. The River has multiple channels at the north study limits. The river channels converge and become more sharply defined at the south end of the study area, before confluence with the Sanitary and Ship Canal.

The other two waterways are smaller, with less impact on east-west vehicular crossings. Long Run Creek is east of the Sanitary and Ship Canal, conveying drainage from the north-east and east. It parallels the shipping canal, but at a much lower elevation, until the canal steps down at the Lockport Locks, and is joined by Long Run Creek. The I & M Canal, a small non-operating canal on the east side of the river valley, is the object of much local historical society activity and the core of the designated National Heritage Corridor. In the study area both Long Run Creek and the I & M Canal are narrow.

Two railroads run along the east side of the River through the study area. The Atchison, Topeka and Santa Fe Railway (Santa Fe) is immediately east of and parallels the Sanitary and Ship Canal; the Illinois Central Gulf Railroad (ICG) is immediately west of New Avenue and Illinois Route 171. These two railroads are generally about one half mile apart. The ICG has more grade crossings, as it is immediately adjacent to developed areas. The Santa Fe's proximity to the Sanitary and Ship Canal limits the vehicular crossings to those which also cross that canal.

The Industrial Railroad, west of the River, is the third rail facility in the river valley. There are numerous industrial sidings on both sides of the river throughout the study area and also a freight classification yard for Santa Fe at the very south end of the study area. A fourth railroad, the Elgin, Joliet and Eastern Railway (EJ&E) crosses the river valley near the southern limits of the study area. It has a lift bridge over the canal, and crosses above Illinois Route 53, the Santa Fe, and the ICG on fixed bridges.

North-South Roadways

The two principal north-south roadways in the study area are Illinois Route 53 on the west and Illinois Route 171 on the east. Each of these two roadways intersects the existing east-west river crossings of 135th Street and Illinois Route 7. The scope of this study is focused on the evaluation of increased traffic carrying capacity between these two north-south roadways.

Weber Road, west of Illinois Route 53 and Gougar Road, east of Illinois Route 171 are additional north-south roads which will become increasingly important traffic carriers as the County Highway Improvement Program is implemented.

Existing River Valley Crossings

Within the study area, 135th Street had a 1980 Average Daily Traffic volume (ADT) of 8,800 vehicles per day. The two lane bridges for 135th Street consist of four box culvert, or simple span type structures spanning the multiple channels of the Des Plaines River. A swing bridge crosses the Sanitary and Ship Canal, with a circuitous approach roadway on its east side. The roadway makes a right-angle turn at the east abutment and traverses down the canal embankment, south of the bridge, to meet grade. Two more right angle turns provide an at-grade crossing at the Santa Fe and turn the direction back to the north along the railway. A fourth right angle turn puts 135th Street back on its east-west alignment. This "U-approach" to the east side of the canal bridge has been identified as a priority for safety improvements. The elevation of the existing bridge deck is too low to allow an adjacent bridge to span the Santa Fe for a continuous straight alignment. Railroad operations of the Santa Fe and the ICG disrupt traffic flow along 135th Street.

East of the study area, 135th Street is already a minor arterial street, with existing residential development set back from the right of way. West of Illinois Route 53, in Romeoville, existing development is closer to the road. Overall, these factors combine to make this corridor a promising location for a new high level bridge.

As one of the limited number of river crossings in the County, the importance of the 135th Street corridor is obvious. It was included in the 1984 Long-Range County Highway Plan, with the recommendation to widen the four existing two lane Des Plaines River bridges to four lanes, and construct a new high level bridge over the Sanitary and Ship Canal and the Santa Fe.

Illinois Route 7 is the only high level bridge in the study area. It was constructed in 1969 by the Illinois Department of Transportation. It is a two lane, 60 foot wide concrete structure, with a 1982 ADT of 17,900 vehicles per day. It is not affected by bridge openings and Santa Fe Railroad operations. However, traffic operation in this area is adversely affected by the at-grade crossing of the ICG railroad, and the traffic signal at Illinois Route 171. East of Illinois Route 171, the Route 7 corridor is densely developed to the east of Thornton Street.

Division Street is in an established river crossing corridor. The Sanitary and Ship Canal bridge was closed six years ago and subsequently torn down. The approach roadways and sub-standard river bridges to the west are in place. On the east, the approach roadway crosses the ICG at grade, a bridge spans the I & M Canal and a second bridge spans both the Santa Fe and Long Run Creek. Local traffic uses the I & M Canal bridge. The Santa Fe-Long Run bridge provides vehicular access to the east bank of the Sanitary and Ship Canal and access to the service roadway for the locks. Prior to the bridge closing, Division Street had an ADT of 6,000 vehicles per day.

Other East-West Roads

The other primary east-west roadways which serve the area intersect with Illinois Route 53 on the west and Illinois Route 171 on the east. Consequently, the most appropriate locations to investigate for a potential new river crossing are those areas where the adjacent street system is already in place.

These other existing east-west roadways include the following:

- Taylor Road/143rd Street
- Airport Road/151st Street
- Caton Farm Road/Bruce Road
- Theodore Street/Rosalind Street

The area between the end of Taylor Road and the end of 143rd Street is presently developed only along the south side, from Illinois Route 171 to High Road. The north side of the existing right of way is undeveloped. West of the River, the alignment would traverse the Material Service quarry. The fact that the area between the termini is presently undeveloped would partially offset the fact that new roadways and rights of way would be required. Right-of-way acquisition would have to compensate for loss of mineral rights. Illinois Route 53 and Illinois Route 171 are approximately three miles apart here. East of Illinois Route 171, development is minimal, with residences set well back from the road.

The area between the end of Airport Road and the end of 151st Street has little development, except for the tank farm of the Texaco Refinery. This two mile long alignment crosses one half mile of the Texaco refinery site. While the refinery is currently not operating, future operation of the refinery is possible. Use of this location, through the tank farm, could be interrupted during any refinery emergencies. This alignment would also traverse the Material Service quarry. Between Illinois Route 171 and the FAP 431/ Gougar Road corridor, there is about 3/4 mile of existing residential development along 151st Street. These residences are set back from the road.

The area between the end of Caton Farm Road and the end of Bruce Road is the least developed of any of the alternative corridors. The only developments of any kind along this one mile long alignment are the locks and the commercial properties along the west side of Illinois Route 171. East of Illinois Route 171; Bruce Road has existing residential development set back from the road, for about 1 mile. Farther to the east, there is little adjacent development.

The area between the end of Theodore Street and Rosalind Street is one of the most densely developed portions of the river valley. Immediately east of Theodore Street is an industrial park, with the extended Theodore alignment shifted to the north. This corridor is about 1.25 miles long. There is a sewage treatment plant between the industrial park and the River. The alignment is just south of the confluence of the Des Plaines River and the Sanitary and Ship Canal. The centerline defines the north boundary of the State Prison property, east of Illinois Route 171.

IV. ALTERNATIVES

In addition to providing increased river crossing capacity, evaluation of the roadway connections required to complete the link between Illinois Route 53 and Illinois Route 171 must consider the characteristics of the east-west corridors, beyond the river/canal area. Options which are incapable of providing route continuity between Weber Road and FAP 431 will not serve the future transportation needs for the area. Likewise, options which would provide continuity, but with facilities that could not reasonably be upgraded to handle the additional traffic volumes, can not be considered as appropriate solutions.

According to the 1984 highway study, a new four lane high level bridge crossing at 135th Street would provide the capacity to meet the projected demand in that corridor. However, even if both the Illinois Route 7 and Ruby Street bridges also had four lanes each, projected demand indicates the need for an additional crossing in the southern part of Lockport Township.

A new two lane facility could accommodate the anticipated traffic demand, however planning for ultimate widening to four lanes should be included in the design of the original construction. For the purpose of this feasibility study, it is assumed that improvement of existing river crossings would provide a four lane facility, whereas construction of a river crossing at a new location would only require an initial two lane cross section.

Romeoville Road/135th Street

Providing a four lane facility in this corridor would require two structures, one to cross the Des Plaines River, and a second to cross the Sanitary & Ship Canal, the Santa Fe, the I & M Canal. The existing road would need to be widened for approximately 1,700 feet, between Illinois Route 53 and the beginning of the River bridge. The River bridge would be approximately 2,200 feet long, and should be placed on the north side of the existing roadway alignment. A portion of new road would need to be constructed to maintain at grade access to the Commonwealth Edison power station. The second bridge would be 1,100 feet long, beginning east of the Edison entrance, and crossing the south side of the existing road alignment, east of the I & M Canal. A portion of new road would need to be constructed to maintain access to the refinery, grain elevator, and other abutting land uses. At grade crossings of the ICG and New Avenue would be provided. Acquisition of additional right of way would be required along most of the length of this corridor. The total length of new roadway would be approximately 3,600 feet. The estimated cost of this option is $25.8 Million.

Taylor Road/143rd Street

A river crossing in this corridor would be on an entirely new location. It would require the construction of about 2,300 feet of new roadway between Illinois Route 53 and the new bridge. The high level structure would span the Industrial railroad, the Des Plaines River, quarry pits, the Sanitary and Ship Canal, and the Santa Fe. Two other structures would span the ICG, New Avenue, High Road and Long Run Creek. The bridges would be 4,300 feet in length. Approximately 6,000 feet of the existing 143rd Street would have to be reconstructed, between the end of the New Avenue bridge and Illinois Route 171. About 2,300 feet of new roadway would be needed between the I & M Canal, and New Avenue. An at grade intersection would be provided at Smith Road. The alignment would require the relocation of the crusher in the Material Service quarry. The cost of acquisition of mineral rights, construction in the quarry, and disruption of quarry operations is likely to be prohibitive. The estimated cost of this alternative is $27.6 Million.

Beyond the study area, 143rd Street and Taylor Road have not been targeted for major improvements. East of Illinois Route 171, 143rd Street is a secondary arterial. However, it is possible that the Illinois Department of Transportation could locate a future FAP 431 interchange at 143rd Street.

Airport Road/151st Street

This corridor would also require the construction of a road on new alignment. Four structures, totalling 3,300 feet long would be required to span all four railroad facilities in this location, the Des Plaines River, the Sanitary and Ship Canal, the I & M Canal, Long Run Creek, and New Avenue. Approximately 3,700 feet of new roadway would be required between Illinois Route 53 and New Avenue, including the portion through the Texaco refinery tank farm. About 2,700 feet of new road would need to be built between the east end of the New Avenue bridge, and Illinois Route 171. An at grade intersection would be provided at High Road.

It is unlikely that an interchange could be provided on FAP 431 at 151st Street due to the proximity of the future interchange at Illinois Route 7, a State marked route. Current interest in an airport industrial park could potentially increase traffic on Airport Road, west of Illinois Route 53. The lack of a connection to FAP 431, coupled with the expensive acquisition and construction costs in the quarry, would indicate that this option should be eliminated from in-depth consideration. The estimated cost for this improvement is $20.5 Million.

Renwick Road/Illinois Route 7

Improvement on this location would consist of widening about 2,000 feet of existing roadway as well as three bridges. In addition to the high level bridge, there is one bridge over the Industrial railroad near Illinois Route 53, and one over the I & M Canal. The high level bridge is wide enough to accommodate four lanes, if shoulders were not provided, and it is approximately 3,000 feet long. In order to bring the bridge up to standards and capacity for a multi-lane facility, widening by 12 feet would be necessary. The estimated cost for upgrading this connection is $4.2 Million.

This work would achieve the initial goal of increasing river crossing capacity, but without extensive modifications to the traffic system in downtown Lockport, and along Illinois Route 7 to the FAP 431 corridor, the increased capacity would not improve traffic operation in the Township. In fact, the conditions of delay in Lockport would probably worsen.

Stateville Road/Division Street

The improvement would require the rehabilitation of the existing roadway for approximately 2,000 feet west of the River. The new high level structure would be 2,000 feet long, spanning the Des Plaines River, the Sanitary and Ship Canal, and the Santa Fe. A second 400 feet long structure would span the I & M Canal and the ICG tracks. The existing structure over the Industrial railroad would have to be rehabilitated, or replaced. The new roadway would meet the existing intersection of Division Street and Illinois Route 171, however, the grade of the intersection may need to be raised. About 1,000 feet of new roadway would need to be constructed between the two new bridges. The estimated cost for re-instating traffic flow on a new high level facility here is $12.7 Million.

This corridor is constrained by its former function as a low-level bridge crossing with direct access to adjacent properties. The approach embankment, on the east side, tightly abuts residential development and the waste water treatment plant. Raising the elevation of the approach roadway for a high level bridge would be complicated, with impacts on existing houses and development and the existing access to the locks. If a new high level bridge were to be constructed here, then replacement access must be provided to the residential properties, as well as the sewage treatment plant and the locks. This new access would need to intersect with Illinois Route 171 either north or south of the present Division Street intersection, crossing the I&M Canal and the ICG tracks.

East of Illinois Route 171, the proximity of existing residences to the Division Street right of way limits the potential for widening the street to accommodate the additional traffic volume which would be generated by a high level river crossing. This would limit the ease and potential of improved traffic capacity and continuity serving a high level bridge at this location. The proximity to the Illinois Route 7 bridge would cause a reduction in downtown Lockport traffic, if a connection to the FAP/Gougar Road corridor is provided. Otherwise, through traffic using the new bridge would still be required to enter the downtown area. The fact that there is an existing river crossing corridor here must be balanced against the impacts which would be caused by upgrading the extended facility to the east.

Caton Farm Road/Bruce Road

A new river crossing on this alignment would require two structures, totaling 2,300 feet long, to span the Des Plaines River, the Santa Fe and ICG railroads, the locks of the Sanitary and Ship Canal and the I & M Canal. Approximately 3,000 feet of new roadway would be required. There would be an at grade crossing of the Industrial railroad, near the west end of the alignment. The new link would connect the existing at grade intersection of Caton Farm Road and Illinois Route 53, with the intersection of Bruce Road and Illinois Route 171. The alignment is sufficiently far north so as to avoid involvement with the landfill which was constructed on the west side of Illinois Route 171. The estimated cost is $11.9 Million.

This location has desireable characteristics, and its position in southern Lockport Township would be a good fit to satisfy the demand for east-west movement. It is midway between Illinois Route 7 and Ruby Street. The overall link between Illinois Route 53 and Illinois Route 171 would be relatively short; shorter than all except the Theodore Street/Rosalind Street corridor. No existing land use or development, between these two routes, blocks this link or impacts through traffic. The topography is a gradual slope to the River Canal. Down stream of the Lockport locks; the elevation of a new bridge would be reduced. The waterways have well defined banks here. Since Illinois Route 171 is on top of the bluff here, a high level bridge would meet it after passing above the adjacent ICG tracks. The roadway would be all new construction. This would accommodate demand for river-crossing in this corridor.

Beyond the study area, there is excellent route continuity, primarily because preliminary plans for FAP 431 have always shown an interchange at Bruce Road. However, the existing facility is not up to multi lane standards. Bruce Road is a County Highway east of the area, swinging north to 167th Street as it continues. Caton Farm Road and Bruce Road exist up to intersections with Illinois Route 53 and Illinois Route 171 respectively.
Caton Farm Road has minimal development, west to Weber Road. Bruce Road has some residential development, but it is signifi-

cantly less dense than the other urban corridors. This would mean fewer impacts resulting from upgrading this existing collector street. Because of its location on a section line, future improvement of Bruce Road may occur without the river/canal crossing, but the improvement would likely be less extensive.

Physical characteristics, existing and projected development, location suited to demand for river crossing and compatibility with long range transportation plans make this a promising location for a new high level bridge.

Theodore Street/Rosalind Street

An improvement in this corridor would include a 3,500 feet long structure with extra high piers, because east of the Sanitary and Ship Canal are the Santa Fe and ICG rail lines, with the EJ&E tracks spanning above them via embankment and bridges. This double stacked rail network is immediately west of Illinois Route 171, which is at the base of the limestone bluff. A high level bridge here, spanning the intersecting railroads, could not intersect at grade with Illinois Route 171. If connections to Illinois Route 171 were to be provided, it would have to be in the form of ramps located east of Illinois Route 171. The west end of this river crossing would require the reconstruction of approximately 2,000 feet of roadway through the industrial area east of Illinois Route 53. An additional 3,000 feet of new roadway would be required to connect the discontinuous pieces of Rosalind Street to Farrell Road. At some time in the future, the road would need to be extended an additional 5,200 feet to Gougar Road. The estimated cost for improvement between Illinois Route 53 and Farrell Road is $19.7 Million.

This location shares all the negative aspects of trying to develop in urbanized residential corridors, like Division Street. However, they are doubled here due to urbanization on both sides of the crossing location. Also, this corridor does not provide a direct connection to Weber Road. Improvements to serve route continuity with a high level bridge could only proceed after addressing extensive impacts to presently developed areas. All of the above, however, are outside the study area, west of Illinois Route 53 and east of Illinois Route 171. Between the two routes, this location has complications of equal magnitude. Access for a large industrial area would inhibit through traffic. This area could be spanned by the new bridge at additional cost, if a suitable alternative access to the industrial area could be identified. Further, there are existing residential roadways atop the east bluff. The complexity providing a link between Illinois Route 53 and Illinois Route 171, the lack of vertical continuity with Illinois Route 171 and the location of the presently isolated residential area combine to indicate low feasibility at this location.

Alternative Evaluation

In order to evaluate the alternatives, a simple ranking system may be used. There are four elements which have been described for each of the alternatives:

- Construction Cost
- Impact upon adjacent land uses
- Ability to lessen traffic demand
- Potential for connecting to FAP 431

For the purpose of this evaluation, an unweighted ranking has been developed. That is, all elements are assumed to have equal importance. The ranking process with respect to land use, demand, and connection potential is somewhat subjective, but it is the most that can be accomplished within the scope of this study.

	EVALUATION ELEMENT					
Alternate	Const. Cost ($ Million)	Land Use Impact	Resolve Demand	Connect. Potential	Total Score	Over All Rank
135th St.	2 ($25.8)	7	3	4	16	4
Taylor/143rd	1 ($27.6)	4	2	5	12	6
151st St.	3 ($20.5)	6	1	2	12	7
Rte. 7	7 ($4.2)	1	4	6	18	2
Division	5 ($12.7)	2	6	3	16	3
Bruce	6 ($11.9)	5	7	7	25	1
Theodore	4 ($19.7)	3	5	1	13	5

This ranking evaluation places the Caton Farm/Bruce Road option first. A more in-depth multiple objective analysis could change the order of the alternate ranking. However, it is unlikely that any of the four lowest ranking options would emerge as most desirable. Also, it can be noted that the Bruce Road option does not have a ranking of 1 or 2 for any of the evaluation elements, unlike each of the other options.

V. RECOMMENDATIONS

Demand now exists for increased vehicular capacity across the river and canal. The concentration of traffic demand created by the single existing high level bridge in downtown Lockport has resulted in congestion on both Illinois Route 7 and Illinois Route 171. However, an additional bridge south of Illinois Route 7 such as Division or Caton Farm/Bruce would draw even more traffic through Lockport, if Illinois Route 171 is the only north-south connector. An essential consideration in recommending a new bridge location is the potential to relieve congestion.

Therefore, it is recommended that the bridge location be linked to two factors. First, good route continuity and traffic capacity to the east, away from Illinois Route 171 and, to a lesser extent, west of Illinois Route 53. Second, development of a good north-south connector, east of Lockport, such as Gougar Road. These two factors must be accommodated to relieve existing congestion and its future projected aggravation.

If these two factors are satisfied, then the traffic needs within Lockport Township will be satisfied by implementation of one of three actions:

1. Improve Bruce Road from Illinois 171 to the north-south connector, improve Caton Farm Road between Weber Road and Illinois Route 53, and build a new high level bridge at the Caton Farm Road/Bruce corridor.

2. Improve Illinois Route 7 through Lockport (from the bridge to Farrell Road, or to the north-south connector), widen the existing bridge to four lanes, and improve Illinois Route 171 through Lockport.

3. Improve Illinois Route 171 through Lockport, improve Division Street through Lockport (at least to Farrell Road or the north-south connector), and build a new high level bridge at Division Street.

The latter two options have limited probability of implementation and would be more expensive due to roadway construction in this more densely developed area. These two also have more complex impacts on the Historic District and the restrictions of the Central Business District's buildings and parking.

Based upon the planned improvement of Gougar Road, construction of FAP 431, and evaluation of impacts on adjacent properties, the Caton Farm Road/Bruce Road location is recommended. The cost of developing a new river crossing in this corridor is about $12 million.

However, if there is no provision of a good north-south connector east of Lockport, the Caton Farm/Bruce location will not reduce traffic congestion in Lockport. It would not, in that case, resolve future transportation deficiencies within the Township.
If the stated needs of the Lockport/Crest Hill corridor cannot be met, then the existing congestion at the Illinois Route 7 bridge in Lockport and its projected future worsening, may be somewhat eased by a new high level bridge at 135th Street.

PUBLIC WORKS AND TRANSPORTATION COMMITTEE

TESTIMONY - CITY OF AURORA INFRASTRUCTURE NEEDS

Like almost every other municipality in the country, the City of Aurora's infrastructure lacks sufficient funding to properly maintain the roads, stormsewers, waterlines and other public facilities that are needed to properly serve the citizens of the community. It is an awesome responsibility to maintain the city's infrastructure needs with the shrinking revenue supplies, the citizens property tax revolt, and infrastructure mandates from state and federal agencies with no revenues to fund said mandates. The city of Aurora's ability to efficiently and effectively serve the public is under much strain in 1990.

The City of Aurora has a population of 93 thousand and is 34 miles southwest of Chicago in the Fox River Valley. Located in both Kane and DuPage counties Aurora is the second largest city in the Chicago metropolitan area. It is expected to grow to over 150 thousand by the year 2,010. This is the fastest growing market area in the country outside the sun belt. Downtown Aurora is bisected by Illinois Route 31 and 25 which follow the Fox River on either side. The I-88 East West Tollway designated as the Illinois Research and Development Corridor has five Aurora Interchanges and traverses the northerly portion of the city. Aurora is served by both the Burlington Northern Railroad Commuter line to Chicago and the Regional Transportation Authority Pace Bus System. It also ownes and operates its own Municipal Airport.

Aurora is a community with much history dating back to 1837 when German immigrants founded the community along the banks of the Fox River. The city has seen much change especially during the past five years as the economic climate improved with increased industrial,comercial, and residential development. However, this growth has come at a cost as service levels and infrastructure are being strained. The City of Aurora in 1990 will spend over $20 million dollars on infrastructure improvements. Much of it is bonded with revenue coming from local sources such as property tax, sales tax, water rates, and a real estate transfer tax. The infrastructure expenses are many and diverse, from a new fire station to a federally mandated water system. From storm and sanitary sewer separation to roadway construction. The costs are great yet the revenues are limited. Recognition is needed from a national level that Aurora and other cities are in desperate need to improve their infrastructure, yet do not have enough have enough financial support to do an adequate job.

The Federal Environmental Protection Agency (EPA) has mandated that the city of Aurora lower radium levels in its drinking water. If we do not bring our water system into compliance the

EPA will restrict any additional hookups to our water system, hence stopping all potential economic growth. The city, in response, is constructing a $38 million dollar water plant that will blend well water and Fox River water to acceptable EPA standards. This mandate was placed on the city with no federal assistance to fund said project. The city has had to increase water rates and local sales tax to find the funds to meet the debt service requirement of a $35 million dollar bond issue. I would ask that before any other federal or state agency mandates a specific project, they also consider how that municipality is to fund it. Too often a city is made responsible to solve a governmental agency's decision but that municipality is not given the tools to adequately solve it.

As like in many older cities Aurora's stormsewer lines and sanitary lines were combined. This has now led to severe flooding problems in some of our older neighborhoods. Whenever a hard rain occurs the citizen complaints range from flooded streets to raw sewage backing up into their basement. Over the past four years we have spent in excess of $10 million dollars to separate these sewer lines. Unfortunately because Aurora is an older community the combined sewer problem is prevalent and will cost over $100 million to solve. The city must prudently manage its infrastructure expenditures, however, it will be impossible to address the combined sewer problem in a reasonable time frame given current available funding sources.

The Fox River bisects the city, and it is a recreational amenity that helps make Aurora stand out from other western suburbs. However, when you have a river you also have bridges. Aurora's bridges were built in the 1920's and 30's and all are now in current need of repair, in fact the New York street bridge which is the major east-west thoroughfare throughout the city is in need of complete replacement at a cost in excess of $3.5 million dollars. And the other downtown bridges are in need of varied levels of maintenance and repair that is in excess of $1 million dollars. Where are these funds to come from?

Aurora's airport has over 450 flights per day of takeoffs and landings. The airport is deemed a major reliever for Chicago's O'Hare airport by the FAA. In order to meet the growing air traffic needs, the airport is proceeding with a $27 million expansion program. This includes new runways and taxiway systems. Aurora's commitment is to five percent of the construction cost or $1.3 million dollars. With all other infrastructure needs placed on the city it will be difficult to allocate needed funds for the airport expansion.

New public buildings in another need for the City of Aurora. With the dramatic population growth the community is experiencing, there is a need to construct two new fire stations at a cost of over $1 million dollars each, not including equipment if we are to maintain our current class two fire rating.

In addition, the City of Aurora needs to construct a new Animal Shelter as the current facility operates out of an abandoned farmhouse. It is estimated that this will cost an excess of $1 million dollars.

And finally a new City Hall must also be considered within the next five years. The current facility is full to capacity, in fact we have had to move several departments out of the current facility into satellite offices due to the lack of space. Construction of said building to meet the needs of a city our size would be far in excess of $15 million.

As you have heard, the City of Aurora's infrastructure needs are many. They span the full gamut of the necessary public services and the city cannot do it alone. We need greater state and federal assistance if we are to maintain and provide adequate public services. Older cities across the nation are in a similar predicament, aging infrastructure is in need of repair yet funds available are not there to meet those demands. We need your help, without it infrastructure will deteriorate and municipalities will not be able to provide to the citizens the quality service that they so deserve.

Joliet/Will County Center for Economic Development

October 25, 1990

The Honorable George Sangmeister
United States Congressman
101 North Joliet Street
Joliet, Illinois 60431

Dear Congressman Sangmeister:

I appreciate the opportunity to submit the following written testimony to the House Committee on Public Works and Transportation meeting to be held in Matteson, Illinois on October 29, 1990.

The CED has the responsibility of assisting existing businesses and encouraging additional businesses to locate within Will County. We wish to express our support for an expeditious solution to the recent closing of the 135th Street bridge in Romeoville. The closing of this bridge has created several critical concerns for the Will County community. Those concerns are as follows:

- The public safety of residents and businesses within the Romeoville fire protection area is greatly compromised since the fire station is on one side of the river and is now unable to serve the residents and businesses of that community.

- The alternate routes for the emergency vehicles are also hampered due to the extreme amount of traffic congestion in both Lemont and Lockport.

  In addition, the large Unoven refinery facility, because of the nature of their business, requires immediate response to emergency situations. Under present circumstances, it is left in a vulnerable position.

Since the Metropolitan Sanitary District has maintained this bridge for the past 90 years, the Village of Romeoville was unaware that they held ownership of the structure. They are now faced with securing funds for a multi-million dollar project.

Will County. Chicago's Neighbor. Breaking New Ground.

Page 2
The Honorable George Sangmeister
United States Congressman
October 25, 1990

We urge your committee to secure funds from the federal government for the financing of reconstruction of this emergency public infrastructure project.

With kind regards, I remain

Sincerely,

Ruth Fitzgerald

Transportation Committee - Joliet/Will County Center for Economic Development

South Suburban
Mayors and Managers
Association

Thomas J. Murawski
President

Beth Royle
Executive Director

September 27, 1990

The Honorable George E. Sangmeister
1607 Longworth House Office Building
Washington, D.C. 20515-1304

Dear Representative Sangmeister:

The South Suburban Mayors and Managers Association (SSMMA) is a multi-municipal organization representing 39 municipalities in Southern Cook and Eastern Will Counties. As such, the Metropolitan Planning Organization for Northeastern Illinois has designated our Association the Regional Council for this area, responsible for the review, evaluation and recommendations regarding transportation projects of all modes in the Southern Suburbs.

I was pleased to receive your letter last week advising of the upcoming hearing of the U.S. House Committee on Public Works and Transportation regarding the rebuilding of infrastructure in our nation. The Transportation Committee of SSMMA is particularly interested in the new surface transportation legislation and has been active in following its progress through our association with the Chicago Area Transportation Study (CATS). As chairman of the SSMMA Transportation Committee, I wish to convey to you some of the issues which concern our Association regarding the upcoming legislation.

Since the mid-1950's, the major focus of surface transportation in the United States has been the interstate highway system. With that system very near completion, it is time to redirect our focus toward a transportation problem of a somewhat different nature: mobility in our urban areas. If left unaddressed, the problem of urban congestion may reach proportions which could bring our major metropolitan areas to a crawl, thus threatening our national economic vitality. The new Surface Transportation Legislation should be directed toward the solution of this problem. An increased proportion of Federal funding should be provided to our nation's urban areas for the purpose of relieving congestion.

In regard to the Federal-Aid Urban Highway Program, our Association is very supportive of the continuation of this concept in the new legislation. This program has been extremely successful in the South Suburbs as it has been in the entire Chicago region since its inception. We strongly encourage the continuation of this Program, or one very similar to it, in which local elected officials have the ability to select and program highway projects on a designated system of roadways which includes those under local jurisdiction. Through this mechanism, priority funding may be identified at the local level in the context of regional planning. Local government is assured a role in maintaining and developing the urban transportation infrastructure. As is currently the case, the Program should continue to function as a pass through process in which a portion of Federal dollars go directly to the local level. A maximum Federal share of the funding split should be specified, but with an overmatch provision as in current legislation.

On behalf of the Transportation Committee and the entire membership of South Suburban Mayors and Managers Association, I wish to emphasize the importance of the above items being addressed in the upcoming Surface Transportation Legislation. We at the local level are depending on the sound judgment of the Surface Transportation Subcommittee of the Public Works and Transportation Committee to create a new transportation program which will enable our nation to retain its economic prominence through an efficient and well maintained transportation network.

Sincerely,

Louis Sherman

Re: Public Hearing
October 6, 1990

Dear Representative Sangmeister:

Due to a previous commitment, I will be unable to attend the October 6, 1990 Public Hearing on the infrastructure of the facilities of the communities which is a must for continued growth, therefore I am submitting written testimony to enter in the record of the hearing.

Our Community, as well as many others are on a restricted status because of radium in our public water system. Our revenues do not allow us the luxury of correcting this problem. We are a growing Community and the safety and welfare of our residents are of great concern to me. Our Village is approximately 4700 population and housing units totals 1325. We have at present 165 homes on the water system, and the rest of the homes are on private wells. All the homes have their own septic system. Many of our residents are senior citizens on fixed incomes. With escalating property taxes to support the educational system and local taxing bodies, as an elected official, I cannot support special assessment districts because of the senior constituents.

When requirements are imposed by Federal and State Authorities, a need for grants to comply is needed by most municipalities.

I strongly urge the passage of legislation on the availability of funding to rectify the radium problems and to help provide to all of our residents public water and sewer.

Thank you for giving me the opportunity to express my concerns.

Sincerely,

Michael F. Rittof, President

September 21, 1990

Representative George E. Sangmeister
1607 Longworth House Office Building
Washington, D.C. 20008

Dear Representative Sangmeister:

In response to your recent correspondence on the local meeting (October 6, 1990) of the House Committee on Public Works and Transportation, I am enclosing a sheet detailing some points that CATS feels should be made regarding the imminent surface transportation program since I serve as the south suburban representative to that organization. I agree with their evaluation.

I believe you are aware of my position on the third regional airport i.e. that the south suburban area is the logical location of a facility that for all practical purposes is universally recognized as necessary not only as an essential factor in a national and international air grid but also as an essential economic benefit to this area.

Other areas mentioned in your letter - transit systems, water supply, sewage treatment solid waste disposal - are certainly items of concern. I would suggest that solutions for these problems not come from the backs of local governments as dictated by federal mandates with no financial support.

Sincerely yours,

Fred W Delaney

CHICAGO AREA TRANSPORTATION STUDY 300 West Adams Street Chicago Illinois 60606

COUNCIL of MAYORS

IMPORTANT POINTS REGARDING THE NEW SURFACE TRANSPORTATION PROGRAM

- retain FAU-type program that has local officials selecting and programming federally funded projects
- focus federal funding on urban areas: for the past 35 years, the national focus has been on the interstate, it should now be on urban areas to retain mobility; urban mobility is a national concern because our national economic vitality is dependent on it
- provide urban funding by formula directly to urban areas
- provide for a single maximum federal share for urban areas and permit overmatch
- increase federal funding directed to urban areas to at least 30% of total federal transportation apportionment or about $4.5 billion (this level would not require a federal MFT increase)
- increase federal MFT for transportation purposes, not debt reduction
- do not permit a transition year to fund out the obligation and balances, because it leaves the surburbs without an FAU program: the surburbs will not have meaningful unobligated balances after FY 91

October 2, 1990

OCT 11 1990

Representative George E Sangmeister
Member of Congress
1607 Longworth House Office Building
Washington, D C 20008

Dear Representative Sangmeister:

Thank you for the opportunity to enter remarks into the written record on the House Committee on Public Works and Transportation's upcoming public hearing regarding infrastructure needs.

Homewood and other south suburban Chicagoland communities have made wise use of available Federal Aid Urban (FAU) funds over the last several years for street improvements. Without these funds, many transportation improvements in our region wouldn't have been constructed. The south suburban region has been one of the few to fully benefit from FAU funds. The availability of this vital source of funding must be continued if our region is to prosper.

However, these funds combined with our share of state motor fuel tax revenues don't keep pace with repairing deteriorating streets and widening other streets where traffic volume has outgrown the designed capacity. For example, in Homewood the village will be spending $570,000 of its general fund revenues on street improvements over the next five years in addition to $2.9 million from its motor fuel tax allotment. FAU funds are thus vital to any major street or transportation improvement project in our region.

Federal funding will also be vital to the development of infrastructure for a third airport in south suburban Chicagoland. Adequate roads and highways, water and sewerage service, and public transportation are all essential if we're to avoid the congestion and other problems the northwest suburbs have experienced around O'Hare Airport. A properly planned third regional airport will serve as a stimulus to the economic development of the south suburbs. Undoubtedly, federal assistance in constructing the infrastructure to serve this airport will be needed.

We appreciate the opportunity to comment on these important issues and hope the House Committee on Public Works and Transportation will continue its financial support of local and regional infrastructure improvements. Please call myself or Homewood Village Manager Larry Lowery if we may provide any additional information on our efforts to keep up with Homewood's infrastructure needs.

Sincerely,

Manny Hoffman, President
Village of Homewood

October 1, 1990

United States House Committee
of Public Works and Transportation
c/o The Honorable Representative
George E. Sangmeister
1607 Longworth House Office Building
Washington, D.C. 20008

Dear Congressman Sangmeister and
Honorable Members of the House Committee:

On behalf of the Citizens of Mokena, I appreciate this opportunity to submit to the Committee our concerns regarding local infrastructure needs.

The Village of Mokena is currently assessing and formulating an overall infrastructure rehabilitation plan which addresses the prioritized needs of our aging community. These needs include: Reconstruction of our Local Road Grid, Drainage and Storm Management Improvements, Water Distribution System Improvements, and Rehabilitation of our Aging Sanitary Sewer Mains.

During the evaluation and development of a local plan to accommodate the above referenced problems, it has become apparent the Village of Mokena lacks sufficient fiscal resources to universally fund all existing infrastructure priorities. Therefore, the remainder of this correspondence will focus upon the established priorities affiliated with our Sanitary Sewer System.

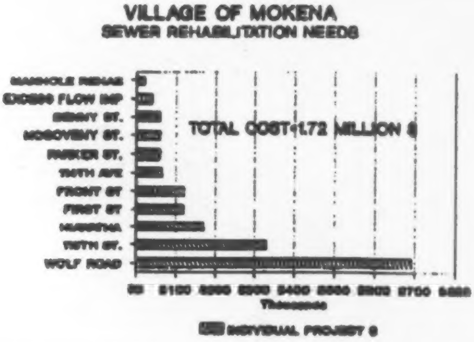
The Village of Mokena is currently undergoing significant geographical and population growth. The ability to service this expanding population base, is being met by a Sewerage Treatment Plant which was constructed in 1987. Although the plant currently

"Planned Progress Pleasant Living"

has available capacity to serve our immediate needs, the potential for insufficient future capacity being available is becoming more apparent.

The Village Board and Staff have evaluated this issue and established a solid course of action for increasing our available plant capacity. Our current sewerage collection system consists of many deteriorated sewerage lines. Several sections of our community are serviced by clay sewerage pipe which were installed in the 1940's and 50's. These pipes have deteriorated to the point of allowing excess infiltration and storm water to enter the collection system during rains. This dilemma causes our Treatment Plant to regularly process more waste water than necessary, consuming much needed plant capacity.

The Village performed a strategic Sewer Analysis Study in 1988 which earmarked the most significant geographical areas contributing to this inflow and infiltration problem. These areas have been prioritized based on the volume of infiltration and our ability to fund the corrective measures needed to improve the system. The Village Board and Citizens of Mokena need financial assistance to address many of these proposed projects. You will note the graph below, indicates priority projects by cost. This chart clearly indicates a minimal of $1.72 million dollars of sewer rehabilitation projects which should be pursued by the Village of Mokena.



COST BY INDIVIDUAL PROJECT

Currently, the Village is working with other State agencies to jointly evaluate and plan infrastructure improvements to our Village. As an example, the Illinois Department of Transportation has been providing information regarding a project scope which will eventually improve a major State artery through our Village. Although no funding exists in this scope for sanitary sewer replacement, it would be prudent to work toward rehabilitating these lines during roadway construction. Unless financial assistance from the Federal or State Government is available, the sanitary mains will most likely not be rehabilitated and continue to contribute to our problem of sewerage system infiltration and reduced plant capacity.

In Summary: The Village of Mokena respectfully requests the House Committee to closely evaluate the infrastructure needs of small local communities throughout the State of Illinois. Although these needs vary with age, demographics, and financial resources, many of today's existing problems cannot be mitigated without the help of both our Federal and State Governments. Please accept this correspondence on behalf myself, the Village Board of Trustees, and the Citizens of Mokena. Your thoughtful consideration and potential assistance in this matter would be of great appreciation by all who reside, work, and prosper in the Village of Mokena.

Sincerely,

Ronald J. Grotovsky,
Village President

FOUNDED 1835
1300 SOUTH BROADWAY/MONTGOMERY ILLINOIS 60538

September 19, 1990

Representative George E. Sangmeister
1607 Longworth House Office Building
Washington D.C. 20515

Dear Representative Sangmeister:

Thank you very much for asking the Village of Montgomery for its input with regards to area infrastructure needs. As the Village is a part of the rapidly growing Fox River Valley, our need for an aggressive infrastructure maintenance/development program is greater than ever. It is my intention with this letter to highlight the importance of these needs to the Village of Montgomery.

The Village has always taken the stance that in order for there to be economic growth, that there must be a strong foundation for this economic growth to take place. Unfortunataly, the [illegible] that make up this foundation require more resources than the Village of Montgomery has to [illegible]. The Village [illegible] of having its transportation systems maintained and updated [illegible] the needs brought on by the Village's expected growth. It [illegible] unreasonable to expect that the population of the Village will increase from its present 4,000 to well over 20,000 by the year 2010. With such a large influx of people (and employment opportunities) there must be adequate transportation systems in place.

Specifically speaking, the transportation needs of the Village will soon dictate that the Route 30 bridge over the Fox River be expanded from two to four lanes. While this project is expected to cost $5,000,000, other road programs in excess of $6,000,000 also need to be addressed. These road projects will link Montgomery with other areas in the region thereby increasing the chances for economic growth region wide. The questions that I most hear from my constituents deal not with the negative aspects of economic growth, but with concerns of how the needs of growth will be addressed.

These needs are genuine and I believe that it is in the best interests of all concerned that they be addressed and acted upon now rather than later when it will be too late. Because of our

Representative Sangmeister
Page two

geographic position, our growth is inevitable and our infrastructure needs must be addressed today rather than tomorrow, when lit will be too late.

Sincerely,

Raymond C. Kozloski

Washington, D.C. 20515-1304

Dear Representative Sangmeister:

I applaud the U.S. House Committee on Public Works and Transportation for embanking on a program of rebuilding our country's infrastructure. We all are aware that local government even with State financial help cannot handle the massive rebuilding of roads, water supply systems, and waste water systems that periodically needs to be done.

I know only too well that in my own community of Sauk Village we are mandated to spend well over a million dollars to stop cross-flow between our storm water and sewer waste systems. Although we are going to get some state help it still required a 150% increase to our residents sewer charge on the water bills. We were required just a few years ago to add a iron-removal system to our two village well houses at a cost of 1.3 million requiring a increase from .50 per 1,000 gallons to $1.60 per 1,000 gallons of water used, a 220% increase.

I mention these two improvements because they are mandated, and rightfully so I must admit, by federal regulations. On top of these improvements our water and sewer lines themselves are constantly being repaired due to ravishes of 30 years plus in service. Village revenue's will be reduced soon due to the changed population numbers per the 1990 census and we are in desperate need of federal help to replace our aging systems. I will make a more general presentation in the areas of transportation as per my position on the South Suburban Mayors and Managers, Transportation Committee.

Sincerely,

Mark Collins

Mark Collins
Mayor

Village of Sauk Village

October 3, 1990

The Honorable George E. Sangmeister
1607 Longworth House Office Building
Washington, D.C. 20515-1304

Dear Representative Sangmeister:

The South Suburban Mayors and Managers Association (SSMMA) is a multi-municipal organization representing 39 municipalities in Southern Cook and Eastern Will Counties. As such, the Metropolitan Planning Organization for Northeastern Illinois has designated our Association the Regional Council for this area, responsible for the review, evaluation and recommendations regarding transportation projects of all modes in the Southern Suburbs.

I was pleased to receive your letter last week advising of the upcoming hearing of the U.S. House Committee on Public Works and Transportation regarding the rebuilding of infrastructure in our nation. The Transportation Committee of SSMMA is particularly interested in the new surface transportation legislation and has been active in following its progress through our association with the Chicago Area Transportation Study (CATS). As a member of the SSMMA Transportation Committee, I wish to convey to you some of the issues which concern our Association regarding the upcoming legislation.

Since the mid-1950's, the major focus of surface transportation in the United States has been the interstate highway system. With that system very near completion, it is time to redirect our focus toward a transportation problem of a somewhat different nature: mobility in our urban areas. If left unaddressed, the problem of urban congestion may reach proportions which could bring our major metropolitan areas to a crawl, thus threatening our national economic vitality. The new Surface Transportation Legislation should be directed toward the solution of this problem. An increased proportion of Federal funding should be provided to our nation's urban areas for purpose of relieving congestion.

In regard to the Federal-Aid Urban Highway Program, our Association is very supportive of the continuation of this concept in the new legislation. This program has been extremely successful in the South Suburbs as it has been in the entire Chicago region since its inception. We strongly encourage the continuation of this Program, or one very similar to it, in which local elected officials have the ability to select and program highway projects on a designated system of roadways which includes those under local jurisdiction. Through this mechanism, priority funding may be identified at the local level in the context of regional planning. Local government is assured a role in maintaining and developing the urban transportation infrastructure. As is currently the case, the Program should continue to function as a pass through process in which a portion of Federal dollars go directly to the local level. A maximum Federal share of the funding split should be specified, but with an overmatch provision as in current legislation.

On behalf of the Transportation Committee and the entire membership of South Suburban Mayors and Managers Association, I wish to emphasize the importance of the above items being addressed in the upcoming Surface Transportation Legislation. We at the local level are depending on the sound judgment of the Surface Transportation Subcommittee of the Public Works and Transportation Committee to create a new transportation program which will enable our nation to retain its economic prominence through an efficient and well maintained transportation network.

Sincerely,

Mark Collins

Mayor Mark Collins
Member, SSMMA Transportation Committee

Washington, D.C. 20515

SUBJECT: Testimony of Mayor William F. Murphy -
Infrastructure Development

Dear Representative Sangmeister:

Enclosed please find a copy of Testimony of Mayor William F. Murphy, Village of Woodridge, regarding infrastructure development throughout the country.

I am requesting the enclosed testimony to be inserted into the official record for the October 6, 1990 field hearing in Matteson, Illinois.

Sincerely,

William F. Murphy
Mayor

TESTIMONY OF MAYOR WILLIAM F. MURPHY

INFRASTRUCTURE DEVELOPMENT

On behalf of the Village of Woodridge, Illinois, I, Mayor William F. Murphy, am pleased to provide this testimony regarding the need to address infrastructure development throughout the country. Specifically, I would like to speak of the Woodridge experience in this matter and also to describe our needs for the next ten (10) years.

The Village of Woodridge has recently celebrated the 30th anniversary of its incorporation. As such many facilities have reached, or are about to reach, their useful life. These include public buildings, streets and bridges, wastewater collection systems and water supply facilities. In response, the Village has undertaken several capital improvement programs to rehabilitate systems and facilities. Over the past ten (10) years, Woodridge has spent over 9 million dollars on infrastructure improvements and expansion projects.

Funding for these projects has increasingly depended upon local sources. Federal programs such as Federal Revenue Sharing, Urban Development Action Grants and U.S. EPA Grants, which had provided substantial resources to local capital improvement projects, have been eliminated or severely reduced.

In addition, the 1986 Tax Reform Act limits local access to capital markets. Without an increased commitment for federal participation in the infrastructure needs of the country, local government will become less able to provide for the transportation and utility needs of all users.

The Village of Woodridge, like much of Northern Illinois, is presently experiencing dramatic growth. The need for new roadway construction and expansion of existing municipal streets represents a commitment of over 15 million dollars over the next ten (10) years.

Rehabilitation of utility systems for water and wastewater are estimated at 1.5 million over the same period. The Village of Woodridge also faces the urgent need for solutions to our nation's solid waste crisis.

TESTIMONY OF MAYOR WILLIAM F. MURPHY
INFRASTRUCTURE DEVELOPMENT

In order to better meet the needs of local government's infrastructure burden, I would encourage the Congress to support the following steps:

- Extension of U.S. Environmental Protection Agency grants for wastewater collection and treatment beyond 1994.
- A sustained federal commitment of 2 to 4 percent of the GNP to infrastructure improvements as recommended by the National Association of Counties.
- The commitment of Federal Highway Trust Funds for the upkeep of the nation's roads.
- Restoration of federal programs supporting the construction of new infrastructure as well as maintaining the old.

In closing, I would like to encourage a new partnership between federal and municipal governments to build and maintain the transportation and utility systems necessary to the economic vitality of the country. The Village of Woodridge sincerely appreciates this opportunity to provide comment to the Committee regarding this important issue.

Sincerely,

William F. Murphy
Mayor

SUBMISSION FOR THE RECORD BY
HON. ROBERT C. STAFANIAK,
MAYOR, CALUMET CITY, IL

CITY OF CALUMET CITY
RECOMMENDED
INFRASTRUCTURE IMPROVEMENTS
AT
VARIOUS LOCATIONS

GENERAL

The City of Calumet City is in an ever ending effort to upgrade and rehabilitate its sewer, water and roadway utilities. Calumet City was initially developed on a street by street expansion whereby as development occurred, sewer, water and roadway improvements were extended to accommodate new growth. As time went on, the system utilities aged and became deteriorated and in need of repair. Calumet City now faces a major crisis in the rehabilitation of its underground and roadway utilities. Calumet City has spent over ten million dollars in storm sewer improvements and approximately five million dollar in street improvements and re-paving within the last few years to keep abreast of utility deterioration. But the funds are not enough to take care of the 100+ miles of streets and sewer and water mains the city has to maintain.

The major improvements that require immediate attention are listed below:

IMPROVEMENT #1 - ROADWAY IMPROVEMENTS 156TH STREET AND 156TH PLACE FROM BURNHAM AVENUE TO STATE LINE ROAD

156th Street and 156th Place from Burnham Avenue to State Line Road are streets that are considered two of the oldest streets within the city. The streets were built in the early 1900's with materials and construction methods that were the state-of-the-art at the time of construction. Throughout the years, the streets have deteriorated to a point where repairs are becoming very difficult and not cost effective. Both streets are faced with collapsing sewers, water main breakage, and pavement failure on a regular basis. It is not uncommon to excavate a portion of the roadway to repair what appears to be small sewer break and find that 20, 30, 40 or 50 feet of sewer needs to be replaced because of its crumbling condition. The same situation holds true for the water main due to its age and brittleness.

Furthermore, the cast iron and galvanized mains which are no longer recommended for modern day designs that are in the ground break due to the stresses of age. The solution to the problem requires total reconstruction of the roadways. This means that the entire roadway surface, including the blacktop, concrete curb and gutters and sidewalks need to be removed along with the removal of the below ground water main and sewer. New ductile iron water mains are required and new concrete sewers are also needed. New catch basins, valve vaults, and manholes are also required because of their existing crumbling conditions. Once new water mains and sewers are replaced, the old ones are removed from the ground and the earth is readied for the new roadway. A new bituminous asphalt pavement is laid, along with new concrete curb and gutters and sidewalks. Once complete, the roadway is completely renovated and new and will devote decades of consistent service.

estimated project cost, including construction and engineering for these two roadway improvements is $2,277,166.00.

IMPROVEMENT #2 - STORM SEWER SEPARATION IN THE SECOND WARD BETWEEN TORRENCE AVENUE, PENN CENTRAL RAILROAD, SIBLEY BLVD. AND STATE STREET AND STORM SEWER SEPARATION IN THE SIXTH WARD BETWEEN WENTWORTH AVENUE, STANLEY BLVD., RIVER OAKS DRIVE, AND THE LITTLE CALUMET RIVER.

Flooding in Calumet City has been an continuing problem. The city has addressed flooding in various wards and has spent over $10,000,000 in the resolution of the flooding problem at various locations. The flooding still occurs thou at other locations. The two projects listed above have not been able to be solved due to the funding plight that Calumet City has. The residents of these wards have suffered phenomenal tragedies of personal property destruction because of the flooding and because of the lack of funding to solve the flooding.

Plans, specifications and bid documents for these two projects are complete and are awaiting funding.

Bids were taken over one year ago to determine the project costs however, because of the funding problems that the city faces no action was taken on the bids.

CITY OF CALUMET CITY
156 TH PLACE IMPROVEMENT
84-129

SPECIAL PROVISIONS

SCOPE - 156th - BURNHAM AVE. TO STATE LINE RD.

This project consists of the reconstruction of roadways including replacement of storm sewer, watermain, appurtenances, curb and gutter and bituminous pavement.

HYDRANTS

Hydrants shall be East Jordan Iron Works or approved equal.

BITUMINOUS DRIVEWAY REPLACEMENT

All bituminous driveways and parkways disturbed due to the construction shall be replaced with either the original thickness or a two-inch (2") bituminous concrete surface course, Class I (Modified) and a six-inch (6") aggregate base course, Type B, whichever is greater. This work shall be paid for at the unit price bid per SQUARE YARD of BITUMINOUS DRIVEWAY PAVEMENT.

P.C. CONCRETE DRIVEWAY PAVEMENT

This item includes the removal and replacement of all concrete drives or parkways, removed in the course of the construction. The thickness shall be the same as the drive removed with a minimum of seven inches (7"), whichever is greater. The drive shall be reinforced with woven wire fabric.

This work is to be done in conformance with the State specifications, and shall be paid for at the unit price bid per SQUARE YARD of P.C, CONCRETE DRIVEWAY PAVEMENT (7").

P.C. CONCRETE SIDEWALK (5")

This item includes the complete removal and replacement of concrete sidewalks, removed in the course of construction. Sidewalks shall be constructed in conformance with the State Specifications for P.C.C. sidewalk and shall be five inches (5") thick. Two-inch by six-inch (2"x6") forms are required for this construction. Handicapped ramps shall be in accordance with State specifications. This work shall be paid for at the unit price bid per SQUARE FOOT of P.C. CONCRETE SIDEWALK (5").

CONCRETE CURB AND GUTTER

This item includes the complete removal and replacement of concrete curb and gutter. The curb and gutter replacement shall be B6.12 (Modified) and shall be constructed in conformance with the State Specifications.

This work shall be paid for at the unit price bid per LINEAL FOOT of COMBINATION CONCRETE CURB AND GUTTER TYPE B-6.12.

BITUMINOUS PAVEMENT REPLACEMENT (STATE)

All work within State jurisdiction shall be backfilled with Aggregate Base Course Type B and the surface replaced in thickness and type in kind. This work shall be paid for at the unit price bid for LIN.FT. of BITUMINOUS PAVEMENT REPLACEMENT (STATE).

LANDSCAPING

Subsequent to the backfilling and general grading of the disturbed areas, and where directed by the Engineer, said areas shall be top-dressed, with 4" of pulvarized topsoil, fine graded, fertilized and sodded. Prior to the sodding, the contractor shall first spread and blend in fertilizer at the rate of 300 pounds per acre. The sodding operation shall conform basically to Section 644 and Article 717.02 of the State of Illinois, Department of Transportation Standard Specifications for Road and Bridge Construction adopted October 1, 1979, except that the prices shall include the fine grading and fertilizer with said work being paid for at the unit price bid per LINEAL FOOT of TOPSOIL AND SOD.

The contractor shall be responsible for watering the area sufficiently for conditions. The water can be obtained from a hydrant near the work undertaken, but prior City Water Department notification is definitely required. The cost of the water will be borne by the contractor.

SAW CUT JOINTS

The removal and/or replacement of any driveways, pavement, curb, sidewalk, etc. shall be accomplished by means of a saw cut joint, at the direction of the Engineer. This work shall not be paid for separately, but shall be included in the unit price bid for the various items.

WATER AND SEWER SERVICE REPLACEMENTS

This item shall include the installation of new watermain and sewer services form the utilities to a point four feet (4') beyond the proposed curb. The water service replacement shall be 3/4" copper including corporation stop, box, curb stop, and fittings as required within the installation limits.

This work shall be paid for at the contract unit price bid per EACH LONG OR SHORT WATER SERVICE (3/4" COPPER) which price shall include all labor, materials and equipment necessary for excavation, bedding, installing and backfilling with Stone CA-10 as herein specified.

The sewer services shall consist of six-inch (6") Vitrified Clay pipes C-700 equipped with a compression type joint of preformed plastic or rubber materials having resilient properties and conforming to all requirements of A.S.T.M. Specification C-425.

Construction methods shall be in conformance with Section 603 of the Standard Specifications. The sewer services shall extend from the main sewer to the existing house service a point four feet (4') beyond the proposed back of curb. Connection to the existing service shall be by mission coupling.

This work shall be paid for at the contract unit price bid per LINEAL FOOT for 6" VSP C-700 (HOUSE SERVICE), which price shall include all labor, materials, and equipment necessary for excavating, bedding, installing, jointing and backfilling with Stone CA-10 as herein specified.

REMOVAL OF EXISTING INLET, CATCH BASINS OR MANHOLES

This work shall consist of all work necessary to remove existing inlets, catch basins or manholes.

The inlet, catch basins or manholes shall be removed and the outlet connection shall be securely sealed with concrete; the resulting cavity shall be filled with sand and thoroughly tamped. In some instances, the resultant cavity will be partially or totally replaced by a new drainage structure. Any cavity remaining after the structure installation shall be filled with suitable trench backfill material.

This work shall be paid for at the contract unit price bid EACH for REMOVAL OF EXISTING INLETS, REMOVAL OF EXISTING CATCH BASINS, OR REMOVAL OF EXISTING MANHOLES, which price shall include all labor, materials, and equipment necessary for excavating and backfilling as herein specified.

TRAFFIC CONTROL

The contractor shall provide the necessary traffic control and protection as adopted by the "Standard Specifications for Road and Bridge Construction".

PUBLIC UTILITIES

The Engineer has attempted to indicate the presence of various public utility lines along the construction route. These locations are from information supplied by the utility companies, and the Engineer, in no way, warrants their accuracy or completeness. It remains the contractor's responsibility to contact the utility companies in order to obtain the definite locations.

STATE SPECIFICATIONS

The "Standard Specifications for Road and Bridge Construction", prepared by the Department of Transportation of the State of Illinois, and adopted on October 1, 1979 are a part of the specifications for this project and are referred to as "State Specifications". However, in case of conflict, the "Special Provisions" shall take precedence and shall govern.

CITY OF CALUMET CITY
2ND WARD STORM SEWER RELIEF PROJECT

88-144

SPECIAL PROVISIONS
CITY OF CALUMET CITY
88-144

PLUG EXISTING OUTLETS:

This work shall consist of the installation of a plug of a size the same as the outlet pipe in the catch basin/inlet indicated on the plan.

This work will not be paid for separately, but will be considered incidental to the sewer installation.

PLUG EXISTING PIPE;

This work shall consist of the installation of a plug of a size the same as the pipe indicated on the plans.

This work will not be paid for separately, but will be considered incidental to the sewer installation.

PLUG EXISTING CATCH BASIN LEADS;

This work shall consist of the installation of a plug of a size the same as the inlet pipe from the existing catch basins in the existing combined sewer manhole.

This work will not be paid for separately, but will be considered incidental to the sewer installation.

BULKHEADS

Bulkheads shall be constructed at the location as shown on the plans. The contractor shall submit to the Engineer the material and method of construction for the approval of the Engineer.

This work shall not be paid for separately, but will be considered incidental to the sewer installation.

PAVEMENT REMOVAL BY SAW CUT:

All existing pavement removal shall be by the saw cut method.

The cost of saw cutting shall not be compensated for separately, but shall be incidental to the contract.

PRECAST RCCP BENDS, TEES, TRANSITIONS, CROSSES:

Precast RCCP bends, tees, transitions, and crosses shall be made of the same material as the pipe and have the same joint specifications. Materials joining these pipe sections shall be free from cracks and shall adhere to the joint surface. All precast pipe fittings shall have inverts as shown on the plans.

STORM SEWER MEASUREMENT:

The lineal foot measurement of the storm sewer for payment purposes shall be through the manholes, bends and transitions. The manholes, bends and transitions shall also be paid for separately at the contract unit price bid for each item.

PIPE BEDDING AND BACKFILL:

Bedding shall be required for all sewer construction, except ductile iron watermain pipe, and shall be a minimum thickness of four inches (4") below the bottom of the pipe. Backfill of the pipe shall be in accordance with Section 1-2.20 of Division II Technical Specifications contained in the bid documents.

PIPE JOINTS:

All pipe placed shall have ASTM C-443 joints.

CATCH BASINS TO BE REMOVED

Existing catch basins which are determined by the Engineer to be in poor condition will be removed and disposed of by the Contractor in accordance with IDOT Specifications Section 501.

This work shall be paid for at the price bid per EACH CATCH BASIN TO BE REMOVED.

CLEAN EXISTING CATCH BASIN

This work shall consist of removal of mud and other deposits in the existing catch basins and inlets as indicated on the plan and/or as directed by the Engineer. The removed material shall be disposed of off-site as directed by the Superintendent of Public Works, City of Calumet City. Due care must be taken to prevent the material removed from the catch basins, inlets, from entering the existing sewers. High pressure jetting shall not be used for this work.

This work shall be paid for at the unit price bid for EACH of CLEAN EXISTING CATCH BASINS. This work will be considered incidental at any structure that has been adjusted, reconstructed or modified.

EXPLORATION TRENCH

The Engineer shall direct the contractor to excavate and locate existing underground utilities to determine their elevation and avoid conflict with the storm sewer. Exposing of existing sanitary sewer services during the normal course of storm sewer construction is not included in this item, but is considered incidental to this contract. All work shall be in accordance with IDOT Specifications Section 220 EXPLORATION TRENCH and shall be paid for at the unit price bid per EACH for EXPLORATION TRENCH.

ADJUST SANITARY SEWER SERVICE

This work shall consist of the removal of existing sanitary sewer service pipe, as directed by the Engineer, wherever there is a grade conflict with the proposed sewer, and the installation of a new sanitary sewer service of the same size as the existing service. It shall also include the installing of ductile iron sewer pipe across the storm sewer trench to prevent the collapse of the existing VSP services into the storm sewer trench. All existing pavement, curb and gutter, sidewalk, etc. disturbed by this work shall be replaced in accordance with the provisions for the same elsewhere in these Special Provisions.

This work shall be paid for at the unit price bid for LIN.FT. of ADJUST SANITARY SEWER SERVICE.

ADJUST WATER SERVICE LINES

This work shall consist of the removal of the existing water services as directed by the Engineer, wherever there is a grade conflict with the proposed sewer. The contractor shall replace the water service with a new service with the necessary fittings of the same size as the existing water service. All existing pavement, curb and gutter, sidewalk, etc. disturbed by this work shall be replaced in accordance with the provisions for the same elsewhere in these Special Provisions.

This work shall be paid for at the unit price bid for LIN.FT. of ADJUST WATER SERVICE LINE.

SEWER CROSSING ENCASEMENT

Where indicated on the plans or as directed by the Engineer, the contractor shall encase in concrete all crossings of the proposed storm sewer with any existing sewer or watermain having less than one foot (1') vertical separation unless directed by the Engineer to replace the sewer or watermain with ductile iron pipe. The cost for this work shall not be paid for separately, but included in the unit price bid per LINEAL FOOT of STORM SEWER.

ADJUST WATERMAIN (6") (12")

This work shall consist of the removal of the existing 6",12" watermain where there is a grade conflict with the new storm sewer or as directed by the Engineer and the installation of new ductile watermain. All bends and necessary fittings needed to accomplish this relocation shall be considered incidental.

The cost for this work shall be paid for at the unit price bid per LINEAL FOOT of ADJUST WATERMAIN (6") (12").

COMBINATION CONCRETE CURB AND GUTTER REMOVAL AND REPLACEMENT

This work shall consist of the removal and replacement of concrete curb and combination concrete curb and gutter in accordance with Sections 616 and 617 of the Standard Specifications, at locations as designated by the Engineer.

The curb shall be replaced in kind.

This work shall be paid for at the contract unit price per LINEAL FOOT of COMBINATION CONCRETE CURB AND GUTTER REMOVAL/REPLACEMENT, which price shall include saw cutting, removal and disposal of surplus material.

Where curb and gutter is removed at a driveway location, access to the property shall be maintained with temporary aggregate.

The restoration of the area behind the curb or curb and gutter shall be four inches (4") of topsoil and sod. At locations where the parkway is not grass, and at drives, the surface shall be removed to a sawed joint (straight) and replaced in kind. The maximum width of restoration behind the curb and gutter removal and replacement shall be two feet (2').

The cost of temporary aggregate, topsoil and sod and any replacement work required either in front of or behind the replaced curb or curb and gutter shall be considered incidental to the cost of COMBINATION CONCRETE CURB AND GUTTER REMOVAL AND REPLACEMENT.

PAVEMENT REMOVAL AND BITUMINOUS REPLACEMENT TYPE III 7.5 INCHES:

All existing pavement that is disturbed due to the installation of the new storm sewer shall be removed by sawcut joint to the limits shown as per these details shown on the plans. The pavement that is to be replaced shall consist of six inches (6") of Bituminous Aggregate Mixture (BAM) and 1-1/2" Bituminous Concrete Surface Course, Cl. I (Mod.). The Bituminous Concrete Surface Course, Cl. I (Modified) shall not be installed for a minimum of one month to allow for trench settlement. All work shall be in accordance with IDOT Specifications Section 620.

This work shall'be paid for at the unit price bid per SQUARE YARD of PAVEMENT REMOVAL AND BITUMINOUS REPLACEMENT TYPE III (7.5 Inch).

BARRICADES, WARNING SIGNS AND LIGHTS; TRAFFIC CONTROL

The contractor shall furnish, erect and maintain such barricades, signs and lights as are necessary to safeguard traffic and protect the work in accordance with Article 107.14 of the Standard Specifications, as specified herein, and as are required by the Engineer. Such barricades, signs and lights shall be provided wherever required to prevent any accident or harm to life, limb, property, or to the work in consequence of the excavation, use or occupancy of streets, alleys, highways or right-of-way.

Operation of flasher lights shall include the furnishing of all electrical energy required. The barricades, signs and lights shall be kept in operation and maintained by the Contractor as long as they are needed to safeguard traffic and protect the work as determined by the Engineer.

Compliance with the above requirements shall be considered incidental to the contract, and no additional compensation will be allowed.

STATE SPECIFICATIONS

All work shall be done in accordance with the IDOT Standard Specifications for Road and Bridge Construction, adopted July 1, 1988.

STORM SEWER TYPE

All storm sewers shall be reinforced concrete of the type and class shown on the plans.

EROSION CONTROL NETTING

A lightweight plastic netting shall be anchored over the straw mulch to stabilize it and prevent erosion.

The erosion control netting type shall be approved by the Engineer and shall be American Excelsior #072-0110 or equal.

This work shall be paid for at the unit price bid per SQUARE YARD of EROSION CONTROL NETTING.

AGGREGATE BASE COURSE, TYPE B

Subsequent to the installation of the new storm sewer in all alleys the trench shall be backfilled with excavated material to an elevation eight (8") inches below the existing grade. The contractor shall then place in two (2) lifts and compact aggregate base course, Type B flush with the existing alley elevation.

The cost for this work shall be paid for at the unit price bid per TON of AGGREGATE BASE COURSE, TYPE B.

PROVIDE EXISTING CATCH BASIN WITH CLOSED LID

Where indicated on the plans, the contractor shall remove the existing open lids on the combined sewer catch basin and replace it with a new closed lid. The old lid shall be delivered to the City of Calumet City Department of Public Works.

The cost for this work shall be paid for at the unit price bid per EACH PROVIDE EXISTING CATCH BASIN WITH CLOSED LID.

REGRADE EXISTING DITCH

The Contractor shall regrade the existing ditch on the south side of State St. from the existing 24" box culvert located 100' + West of Exchange Avenue to the proposed reinforced concrete flared end section at Exchange Ave. A straight uniform grade shall be used to match the invert of the existing box culvert and the invert of the proposed reinforced concrete flared end section.

The cost for this work shall be paid for at the unit price bid per LINEAL FOOT of

REGRADE EXISTING DITCH.

MANHOLE, TYPE (K), (L), (M), AND (N)

Where indicated on the plans, the contractor shall construct manholes, Type (K), (L), (M) and (N). These manholes shall be constructed of material and size as shown in the details provided in the plans.

The cost for this work shall be paid for at the unit price bid per EACH MANHOLE, TYPE (K), (L), (M) and (N).

LIFT STATION

The supplier shall furnish and install the complete factory built lift station as manufactured by the Metropolitan Pump Company Lemont, Illinois or approved equal. System shall include two submersible pumps with hydraulic sealing diaphragms, guiderails, pump mounting plates with discharge elbow and bottom rail supports, access frame with cover for each pump and top guiderail supports, wiring bracket as required, all installed in fabricated steel basin. A Nema 3-R weatherproof control box shall be supplied for mounting remote as required. Structure and dimensions to be as shown on drawing.

OPERATING CONDITIONS:

Each pump shall have a capacity of 3100 GPM at a total head of 30 feet when operating at 870 RPM. Pump motor shall be 30 HP, 870 RPM, 3 Phase, 480 Volts, 60 Hz.

SUMP BASIN:

The fabricated steel basin shall have an inside diameter of 12 feet 0 inches and an inside height of 33 feet and 0 inches. Basin walls, top and bottom shall be of 3/8" structural steel plate. Bottom of basin shall be reinforced with I beams. Beams shall extend 1 foot beyond basin for anchoring to concrete basin. Lifting lugs shall be provided on the outside for handling. The access frame and hinged covers shall be fastened to basin top. Basin shall be sandblasted inside and outside to remove scale, weld, slag, rust, etc., before painting. Basin shall be coated inside and outside with two coats of tar base epoxy paint. Pump mounting plates shall be bolted to basin bottom plate. Discharge piping from pump bases shall be mounted in basin and extended through basin wall for attaching to piping in valve vault. Valve vault shall be of the same diameter as the sump basin, and shall nclude an access hatch, detachable ladder, with check valves and plug valves of the size shown.

PIPING:

Piping in the basin shall be 12 inch steel pipe and shall terminate with a flange outside the basin wall for connection to valves in external valve vault. Inlet or inlets into basin shall be grout sleeves for 15-inch inlet pipe. The pump guiderails shall be 2" S.S. pipe. Intermediate guiderail supports shall be used if basin is more than 15 deep. Discharge shall be plain end pipe. A 12-inch riser pipe with threaded pipe cap shall be connected to a 3-way plug valve in the valve vault, for emergency pumping capabilities.

IMPRESSED CURRENT ANODE SYSTEM:

The structure guard shall be built with solid state circuitry to automatically adjust the applied anode voltage, providing Cathodic Protection regardless of soil resistivity. The system shall utilize two cast iron high silicone anodes.

A separate silicone rectifier module shall be provided for each anode and each module shall feed a constant current of 100 milliamps to the anode it serves.

An indicator light shall allow for check or anode operation. The system shall operate on 120 volt, AC, 60 Hertz power with less than 1 amp draw. The system shall be protected by a type 3AG fuse, which shall have a light that glows if the fuse is blown.

SUBMERSIBLE PUMP - MOTOR CONSTRUCTION:

Each pump shall be of the sealed submersible Type Model No. S12L. Pump shall be capable of handling raw, unscreen sewage with two port non-clog type impellers. Pump casing shall be fitted with bronze wear ring. Pump shall have two mechanical seals in tandomwith oil chamber between the seals. Rotating seal faces shall be carbon and stationary seal faces to be ceramic.Opposed seals will not be accepted. Pump motor shall be of the oil filled sealed submersible type with standard insulation for operation in high-dielectric oil to give better heat dissipation and longer bearing life. Motor stator shall be held in place with removable end ring so that it can be removed for repair without heating outer shell or using a press. Motor housing shall be filled with high-dielectric oil and no pressure balancing devices shall be used. Pump motor shaft shall be of 303 stainless steel. Pump shaft shall have a stainless steel shaft sleeve for longer wear. Pump shall be a standard production pump with attached railguides and discharge sealing flange. Rail guides shall be fastened to pump so that all lifting loads will come on the guide supports and not on the pump or motor housing. A lifting chain and hook shall be supplied for each pump. Pump shall have a direct center of gravity lift out action. Motor will be provided with heat sensing units which shall trip the starter if the motor overheats. Seal chamber shall be fitted with an electrode probe to detect water in the seal chamber.

HYDRAULIC SEALING FLANGE:

The discharge of each pump shall be fitted with a diaphragm-type hydraulically operated sealing flanged. When pump is in operation, pressure shall force diaphragm against discharge elbow flange providing a leak-proof seal. When pump is idle, pressure shall be removed from diaphragm so that pump can be removed from sump with no mechanical contact of sealing flanges. Complete weight of pump to rest on bottom support plate, no weight to be supported on guiderails or discharge elbow. Sealing diaphragm material to be Buna N rubber. Metal to metal sealing flange type connection which is highly susceptible to "corrosion welding" is not acceptable.

PUMP MOUNTING BASES:

A separate mounting plate shall be furnished for each pump. These plates shall include adjustable guide rail supports and discharge elbow with flange to align with pump hydraulic sealing flange. Discharge elbow shall be 125 lb. Standard flange 12" pipe size. Plates and fittings shall be coated with tar base epoxy paint. Sealing face of discharge elbow shall be coated with sprayed on metal (pure zinc) for smoothness and corrosion resistance.

ACCESS FRAME AND COVER:

A duplex door access frame assembly shall be supplied. Access frame and covers shall be fabricated of aluminum and bolted to basin. Frame shall support guiderails and electrical wiring bracket. A separate hinged cover shall be provided for each pump. Cover shall be provided with lifting handle and safety latch to hold cover in the open position. Locking hasps shall be furnished for each cover. Hatch for valve vault shall be a single door to match wet well.

ELECTRICAL CONTROL PANEL-MOUNTED IN FREE STANDING MODULE:

Control panel shall have a Nema 3-R weatherproof enclosure and shall be dead front with separate removable inside panel to protect electrical equipment. A lock hasp shall be provided on outside door. A circuit breaker shall be provided for each pump and a magnetic starter with 3 leg overload protection shall be supplied for each pump. An alternating relay shall be provided to alternate pumps on each successive cycle of operation. Starters shall have auxiliary contacts to operate both pumps on override condition. An interlock relay shall be provided to automatically re-connect the control circuit in case of circuit breaker trip on one pump. H-O-A switches and run lights shall be supplied for each pump. Terminal strip shall be provided for connecting pump and control wires. Pump control box shall be mounted on panel stand at the station or remote as required. Elapsed time meters and seal failure indicating lights shall be furnished for each pump and installed in panel. Panel shall include a generator receptacle and automatic 200 amp transfer switch.

WIRING BRACKET:

Wiring bracket shall provide cord grip holders for the pump cords and the control cords. All cords shall extend from bracket through conduit to control box. No splices shall be made in the wiring. Continuous cords must be used from control panel to pumps and controls. Wiring bracket shall be fastened to access frame. Kellum connectors shall be furnished for each pump cord.

SUMP LEVEL CONTROLS:

Sealed float type mercury switches shall be supplied to control sump level and alarm signal. The mercury tube switches shall be sealed in a solid polyurethane float for corrosion and shock resistance. The support wire shall have heavy neoprene jacket and a weight shall be attached to cord above the float to hold switch in place in sump. Weight shall be above the float to prevent sharp bends in the cord when the float operates under water. The float switches shall hang in the sump supported only by the cord that is held to the wiring channel. Four float switches shall be used to control level. One for pump turn-on, one for pump turn-off, one for two pumps turn-on and one for three pumps on. A fifth switch shall be provided for high level alarm. Float switches shall be Model No. 3900.

ALARM:

A high water alarm light shall be furnished. Alarm light shall be mounted on side of free standing colntrol module. The red light shall flash in alarm mode and shall have reset button. Alarm system shall include contacts for hook-up with existing computer system.A telemetry transmitter shall be provided to interface with said computer.

All equipment required to interface with the computer system to monitor the on/off, hi/low levels and pump fail shall be furnished under this contract.The supplier shall also include in his bid item #2 the cost of reprogramming the conputer to display a seperate screen for the activites of the lift station as well as 24-hour,7 day and 30 day graphs of flow.

OPERATION OF SYSTEM:

On sump level rise lower mercury switch shall first be energized, then upper level switch shall next energize and start lead pump. With lead pump operating sump level shall lower to low switch turn-off setting and pump shall stop. Alternating relay shall index on stopping of pump so that lag pump will start on next operation. If sump level continues to rise when lead pump is operating, override switch shall energize and start lag pump. Both lead and lag pump shall operate together until low level switch turns off both pumps. If one pump should fail for any reason, the second pump shall operate on the override control. All level switches shall be adjustable, for level setting, from the surface.

The contractor shall be responcable for the furnishing of a transformer pad and conduit and wiring to the lift station and stand by generator. The power feed to the pad shall be paid by the city. All necessary wiring, conduit, meter socket equipment and appurtenances required for the complete connection and operation of the lift station and the stand by generator listed herein or otherwise required shall be provided by the contractor.

STANDBY GENERATOR

The supplier shall furnish a stand-by generator set, Model SS-100-18 as manufactured by U.S. Motors Corporation or equal. The unit shall consist of the components listed below, new and unused, all assembled and tested as a complete unit by the set manufacturer. The unit shall be rated 90 continuous,100 standby and output shall be 230 volts connected for 3 phase, 4 wire.

FUEL

The fuel shall be diesel.

ENGINE

The engine shall be 4 cylinder, 4 cycle liquid cooled with V-belt driven water pump through a radiator with pusher fan system, dry manifolds and shall develop 166 HP at 1800 RPM. Engine shall be equipped with remote-controlled positive engaging electric starter system which does not become disengaged until the engine is self-sustaining; positive pressure oiling system which oil filter, injector for specified fuel, battery recharging with automatic static voltage regulator and minimum 5 amp output; cooling thermostat; a mechanical speed and frequency governor with maximum droop not to exceed 5% at full load. In addition, engine will be equipped with high temperature and low oil pressure and overspeed safety shutdown and latch off three indicators and manual reset. An air cleaner shall be furnished.
Cooling system shall use radiator and fan.

EXHAUST

The exhaust system shall include a flexible exhaust with MPT threaded ends and a residential type muffler sized so that back pressure does not exceed 20 inches of water when installed.

GENERATOR

There shall be provided a four pole, revolving field, open drip-proof synchronous alternating current generator rated 125KVA with brushless exciter and static automatic silicon controlled rectifier voltage regulator, with minimum adjustment rate of 5%. Unit shall be of single bearing construction, directly connected to the engine by a semi-flexible steel drive disc. The stator and the armature shall be laminated silicon steel, and all windings shall be twice dipped and baked in insulating varnish. The units shall have a centrifugal blower to force air through the generator which is to operate at 70 degrees centigrade continuous rated temperature rise. Insulation shall be Class F. Temperature rise shall not exceed NEMA MGI-22.40 at the standby rating.

Generator unit shall be of the three phase 12 lead broad range reconnectible and shall have a transient overload capacity of 200% of rated KVA at low power factor for motor starting. Voltage change shall not exceed 12% on application or removal of full load with two second recovery. Maximum voltage shall not exceed plus or minus 1%.

UNIT MOUNTING AND ACCESSORIES

The entire unit shall be assembled and mounted on a steel frame base of rigid construction. The base shall include a unit mounted battery rack, complete with one battery for 12 volts operation . A unit mounted vibration isolated control box including equipment for voltage regulation and engine control; field circuit protection; overcranking protection; terminal board for remote control connections; oil pressure gauge; coolant temperature gauge; static regulated battery charging with battery charging ammeter; safety shutdown for low oil pressure and high coolant temperature and overspeed with three failure indicators; an output terminal box for power connections; voltmeter; ammeter and meter transfer switch frequency meter, hourmeter and a local/off remote switch shall be furnished. In addition, the unit manufactured shall provide properly sized vibration isolators for placement between the base and floor.

In addition to the above operation specifications, the system shall be equipped with the following accessories:

A. Automatic cycle cranking to allow 5 - ten to fifteen second cranking cycles with ten to fifteen second rest periods between cranking attempts. Cranking shall lock out and light an indicator after five attempts. It shall reset automatically if engine starts or manually if engine does not start after five attempts. No thermal devices will be permitted.

B. Exerciser timer with load pick-up minimum operation of 15 minutes once per week.

C. Regulated constant voltage static temperature compensated battery charger rated five amps minimum. O.C. charging ammeter; regular shall taper to trickle for fully charged battery, and shall be automatically disconnected from the battery during cranking.

D. Load circuit breaker

TESTING

Prior to shipment, the generator set manufacturer shall set up the test on the generator and shall certify that the unit has performed satisfactorily.

INSTALLED ACCESSORIES SHALL BE:

Mounted battery, rack and cables
Lock-out relay
Day tank with transfer pump and switch
100-gallon fuel tank Built in base
Steel weatherproof housing with locks

AUTOMATIC TRANSFER CONTROL

The supplier shall supply, test and certify a 200 amp automatic transfer control system including a transfer switch rated 600V AC for inrush current 20 times continuous rating and current interruption capacity six times rated, to handle motor tungsten or mixed loads. Switches shall be mechanically held in the normal position. There shall be three normal line voltage sensing relays and sequencing controls such that the loss of power in any normal line below 75% rated voltage initiates transfer to second power supply. Upon restoration of power, the transfer panel, after a time delay adjustable to 10 minutes, shall transfer load back to normal line. The contractor shall be U.L. listed for this service. In addition to the above operational specifications, the system shall be equipped with the following accessories:

(1) An on-off switch with indicator to prevent transfer during service periods.

(2) A test switch to permit simulation of normal line failure including pick-up of the emergency line.

(3) Adjustable close differential relays.

TESTING

Prior to shipment, the manufacturer shall set up the test on the automatic transfer panel and shall certify that the unit has performed satisfactorily.

The cost for furnishing and installing the stand by generator and lift staion complete including electrical work shall be paid for per L SUM for LIFT STATION - COMPLETE.

CITY OF CALUMET CITY

STORM RELIEF SEWER
AREA SOUTH OF 159th STREET
AND
WEST OF WENTWORTH AVENUE
6th WARD SEWER SEPARATION
88-145

SPECIAL PROVISIONS
CITY OF CALUMET CITY
88-145

PLUG EXISTING OUTLETS:

This work shall consist of the installation of a plug of a size the same as the outlet pipe in the catch basin/inlet indicated on the plan.

This work will not be paid for separately, but will be considered incidental to the sewer installation.

PLUG EXISTING PIPE;

This work shall consist of the installation of a plug of a size the same as the pipe indicated on the plans.

This work will not be paid for separately, but will be considered incidental to the sewer installation.

PLUG EXISTING CATCH BASIN LEADS;

This work shall consist of the installation of a plug of a size the same as the inlet pipe from the existing catch basins in the existing combined sewer manhole.

This work will not be paid for separately, but will be considered incidental to the sewer installation.

BULKHEADS

Bulkheads shall be constructed at the location as shown on the plans. The contractor shall submit to the Engineer the material and method of construction for the approval of the Engineer.

This work shall not be paid for separately, but will be considered incidental to the sewer installation.

PAVEMENT REMOVAL BY SAW CUT:

All existing pavement removal shall be by the saw cut method.

The cost of saw cutting shall not be compensated for separately, but shall be incidental to the contract.

PRECAST RCCP BENDS, TEES, TRANSITIONS, CROSSES:

Precast RCCP bends, tees, transitions, and crosses shall be made of the same material as the pipe and have the same joint specifications. Materials joining these pipe sections shall be free from cracks and shall adhere to the joint surface. All precast pipe fittings shall have inverts as shown on the plans.

STORM SEWER MEASUREMENT:

The lineal foot measurement of the storm sewe for payment purposes shall be through the manholes, bends and transitions. The manholes, bends and transitions shall also be paid for separately at the contract unit p ice bid for each item.

PIPE BEDDING AND BACKFILL:

Bedding shall be required for all sewer construction, except ductile iron watermain pipe, and shall be a minimum thickness of four inches (4") below the bottom of the pipe. Backfill of the pipe shall be in accordance with Section 1-2.20 of Division II Technical Specifications contained in the bid documents.

PIPE JOINTS:

All pipe placed shall have ASTM C-443 joints.

CATCH BASINS TO BE REMOVED

Existing catch basins which are determined by the Engineer to be in poor condition will be removed and disposed of by the Contractor in accordance with IDOT Specifications Section 501.

This work shall be paid for at the price bid per EACH CATCH BASIN TO BE REMOVED.

CLEAN EXISTING CATCH BASIN

This work shall consist of removal of mud and other deposits in the existing catch basins and inlets as indicated on the plan and/or as directed by the Engineer. The removed material shall be disposed of off-site as directed by the Superintendent of Public Works, City of Calumet City. Due care must be taken to prevent the material removed from the catch basins, inlets, from entering the existing sewers. High pressure jetting shall not be used for this work.

This work shall be paid for at the unit price bid for EACH of CLEAN EXISTING CATCH BASINS. This work will be considered incidental at any structure that has been adjusted, reconstructed or modified.

EXPLORATION TRENCH

The Engineer shall direct the contractor to excavate and locate existing underground utilities to determine their elevation and avoid conflict with the storm sewer. Exposing of existing sanitary sewer services during the normal course of storm sewer construction is not included in this item, but is considered incidental to this contract. All work shall be in accordance with IDOT Specifications Section 220 EXPLORATION TRENCH and shall be paid for at the unit price bid per EACH for EXPLORATION TRENCH.

ADJUST SANITARY SEWER SERVICE

This work shall consist of the removal of existing sanitary sewer service pipe, as directed by the Engineer, wherever there is a grade conflict with the proposed sewer, and the installation of a new sanitary sewer service of the same size as the existing service. It shall also include the installing of ductile iron sewer pipe across the storm sewer trench to prevent the collapse of the existing VSP services into the storm sewer trench. All existing pavement, curb and gutter, sidewalk, etc. disturbed by this work shall be replaced in accordance with the provisions for the same elsewhere in these Special Provisions.

This work shall be paid for at the unit price bid for LIN.FT. of ADJUST SANITARY SEWER SERVICE.

ADJUST WATER SERVICE LINES

This work shall consist of the removal of the existing water services as directed by the Engineer, wherever there is a grade conflict with the proposed sewer. The contractor shall replace the water service with a new service with the necessary fittings of the same size as the existing water service. All existing pavement, curb and gutter, sidewalk, etc. disturbed by this work shall be replaced in accordance with the provisions for the same elsewhere in these Special Provisions.

This work shall be paid for at the unit price bid for LIN.FT. of ADJUST WATER SERVICE LINE.

SEWER CROSSING ENCASEMENT

Where indicated on the plans or as directed by the Engineer, the contractor shall encase in concrete all crossings of the proposed storm sewer with any existing sewer or watermain having less than one foot (1') vertical separation unless directed by the Engineer to replace the sewer or watermain with ductile iron pipe. The cost for this work shall not be paid for separately, but included in the unit price bid per LINEAL FOOT of STORM SEWER.

ADJUST WATERMAIN (4") (6") (8") (10")

This work shall consist of the removal of the existing 4",6",8",10" watermain where there is a grade conflict with the new storm sewer or as directed by the Engineer and the installation of new ductile watermain. All bends and necessary fittings needed to accomplish this relocation shall be considered incidental.

The cost for this work shall be paid for at the unit price bid per LINEAL FOOT of ADJUST WATERMAIN (4") (6") (8") (10").

COMBINATION CONCRETE CURB AND GUTTER REMOVAL AND REPLACEMENT

This work shall consist of the removal and replacement of concrete curb and combination concrete curb and gutter in accordance with Sections 616 and 617 of the Standard Specifications, at locations as designated by the Engineer.

The curb shall be replaced in kind.

This work shall be paid for at the contract unit price per LINEAL FOOT of COMBINATION CONCRETE CURB AND GUTTER REMOVAL/REPLACEMENT, which price shall include saw cutting, removal and disposal of surplus material.

Where curb and gutter is removed at a driveway location, access to the property shall be maintained with temporary aggregate.

The restoration of the area behind the curb or curb and gutter shall be four inches (4") of topsoil and sod. At locations where the parkway is not grass, and at drives, the surface shall be removed to a sawed joint (straight) and replaced in kind. The maximum width of restoration behind the curb and gutter removal and replacement shall be two feet (2').

The cost of temporary aggregate, topsoil and sod and any replacement work required either in front of or behind the replaced curb or curb and gutter shall be considered incidental to the cost of COMBINATION CONCRETE CURB AND GUTTER REMOVAL AND REPLACEMENT.

PAVEMENT REMOVAL AND BITUMINOUS REPLACEMENT TYPE III 6 INCH :

All existing pavement that is disturbed due to the installation of the new storm sewer shall be removed by sawcut joint to the limits shown as per these details shown on the plans. The pavement that is to be replaced shall consist of six inches (6") of Bituminous Aggregate Mixture (BAM) constructed flush with the existing pavement. The BAM shall not be resurfaced over for a minimum of one month after its installation to allow for trench settlement. All work shall be in accordance with IDOT Specifications Section 620.

This work shall be paid for at the unit price bid per SQUARE YARD of PAVEMENT REMOVAL AND BITUMINOUS REPLACEMENT TYPE III 6 Inch.

6" (8") (10") (12") (15") (18") (21") (24") (30") ETC. DUCTILE IRON SEWER PIPE CL.52

The Contractor shall remove the existing sanitary sewer and replace it with Ductile Iron Sewer Pipe Cl.52 at location directed by the Engineer. When the existing sanitary sewer is within 1 vertical foot of the storm sewer, the transition from the existing sanitary sewer to the ductile iron sewer pipe shall be made with a band seal coupling. Sanitary sewer installation shall be in accordance with Division II TECHNICAL SPECIFICATIONS. Bypass pumping shall be included.

This work shall be paid for at the unit price per LINEAL FOOT of 6" (8") (10") (12") (15") (18") (21") (24") (30")ETC. DUCTILE IRON SEWER PIPE CL. 52.

BITUMINOUS DRIVEWAY PAVEMENT

Where existing bituminous driveways are to be removed, they shall be removed by means of a straight sawed cut joint and restored with six inches (6") of Aggregate Base

Course, Type B, and two inches (2") of Bituminous Concrete Surface Course, Class I (Modified). The cost for sawing, Aggregate Base Course, Type B and the Bituminous Concrete Surface Course, Class I, shall not be paid for separately, but included in the unit price bid per SQUARE YARD of BITUMINOUS DRIVEWAY PAVEMENT.

CLEAN AND TELEVISE SEWERS

Prior to beginning construction the contractor shall clean and televise the existing sewers shown on the plan for the purpose of determining if the sewer is a combination or separate storm sewer. Special attention shall be paid to locating all underground connections. A color camera, two copies of a VHS video tape and a typed written report are required.

The work shall be paid for at the unit price bid per LINEAL FOOT of CLEAN AND TELEVISE SEWERS.

FENCE REMOVAL/REPLACEMENT

The contractor shall remove the existing fence and replace it with an equivalent new fence.

This work shall be paid for at the unit price bid per LINEAL FOOT of FENCE REMOVAL/REPLACEMENT.

BARRICADES, WARNING SIGNS AND LIGHTS; TRAFFIC CONTROL

The contractor shall furnish, erect and maintain such barricades, signs and lights as are necessary to safeguard traffic and protect the work in accordance with Article 107.14 of the Standard Specifications, as specified herein, and as are required by the Engineer. Such barricades, signs and lights shall be provided wherever required to prevent any accident or harm to life, limb, property, or to the work in conseqzuence of the excavation, use or occupancy of streets, alleys, highways or right-of-way.

Operation of flasher lights shall include the furnishing of all electrical energy required. The barricades, signs and lights shall be kept in operation and maintained by the Cotnractor as long as they are needed to safeguard traffic and protect the work as determined by the Engineer.

Compliance with the above requirements shall be considered incidental to the contract, and no additional compensation will be allowed.

STATE SPECIFICATIONS

All work shall be done in accordance with the IDOT Standard Specifications for Road and Bridge Construction, adopted July 1, 1988.

48" SLUICE GATE CHAMBER

This item shall consist of the construction complete and in place of a sluice gate chamber with a sluice gate of the size specified in accordance with the detail shown on the plans. Concrete shall be Class "X" 3500 psi at 14 days. The sluice gate and crank operated floor stand shall be Rodney Hunt or approved equal. Concrete test cylinders shalll be made and tested by an approved materials testing lab oratory.

This work shall be paid for at the unit price bid per EACH - 48" SLUICE GATE CHAMBER.

CONNECTION TO EXISTING INTAKE CHAMBER

This item shall consist of all work required to connect the proposed 90" storm sewer to the existing pump station. The north/south walls of the existing chamber shall be removed as required. The storm sewer /pump station junction shall be grouted and calked to provide a water tight seal. Removal of the existing 66" storm sewer shall be included.

This work shall be paid for at the unit price bid per EACH -CONNECTION TO EXISTING INTAKE CHAMBER.

BUTT JOINTS

Butt joints shall be required where the proposed resurfacing meets existing pavement.Butt joints shall be considered incidental.

STORM SEWER TYPE

All storm sewers shall be reinforced concrete of the type shown on the plans and the Class as shown in the following table:

KIND OF MATERIAL PERMITTED AND STRENGTH REQUIRED FOR THE
RESPECTIVE DIAMETERS OF PIPE AND FILL HEIGHTS OVER THE TOP OF THE PIPE FOR STORM SEWERS

Nominal Dia.	Type 1 & 1B						Type 2 & 2B

SECOND WARD STORM SEWER RELIEF PROJECT
CITY OF CALUMET CITY

ADDENDUM #1

August 21, 1989

Alternate No. 1

The city is taking an alternate bid for the installation of a 6" PVC underdrain system around the perimeter of the retention pond. The underdrain system shall be located at the top of the bank approximately below the proposed chain link fence and at other locations determined by the engineer.

The underdrain system shall be installed at an average depth of approximately equal to 6 feet below the proposed ground along the perimeters of Arthur Ave., Houston Ave., and Stewart Ave. The PVC underdrain installation shall be equal to that shown in the attached detail. 48" manholes shall be constructed at locations determined by the engineer.

The contractor shall make provisions for temporary pumping at the lift station location with this footing drain system until the lift station is in operation. The contractor shall be responsible for connecting the underdrain system to the lift station wetwell upon completion of the project.

The cost of the underdrain system including PVC pipe, gravel, geotextile fabric, excavation, and backfill shall be paid for per LIN.FT. of 6" PVC UNDERDRAIN.

Item No.	Item	Approx. Quan.	Unit Prices	Amount
56	6" PVC Underdrain	4,000 Lin.Ft.	$20.00	$80,000.00
57	MAN TA 48" Dia T1 FCL	12 Ea.	740.00	8,880.00
	Total Alternate 1			$88,880.00

Alternate No. 2

The city is taking an alternate bid on a slurry cutoff trench around the perimeter of the retention pond site in the event drawdown of the water table becomes critical to adjacent property owners. The slurry trench shall be constructed to a depth determined by the Engineer.

Observation wells approximately 20 feet deep shall be installed prior to installation of the slurry cutoff trench by a qualified soil engineer approved by the engineer. The wells shall be covered and locked. The observation wells shall be located at the soils engineer's direction to determine if the slurry cutoff trench is maintaining the ground water level outside the detention pond. If the observation wells show that the slurry cutoff trench is not functioning adequately, the contractor shall repair the slurry cutoff trench at no additional cost.

Trench shall be essentially vertical. An approved slurry mixture shall be pumped under controlled pressure through the underlying stratas and keyed into an impervious material.

The Contractor will be required to submit evidence that he is competent to construct a slurry trench. This evidence will insure that the Contractor or his subcontractor will have sufficient competent personnel to carry out the operations specified, and such personnel (as approved by Engineer prior to award of Contract) will have previous experience in the type of construction. In particular, a construction and slurry specialist(s) shall be used to supervise the construction, slurry preparation, and quality control.

Slurry shall consist of a stable colloidal suspension of pulverized natural sodium-cation bentonite or bentonite and cement in water.

A. Bentonite: High quality pulverized natural sodium-cation material. A written certification shall be supplied specifying the quality per each load shipment of bentonite received. Additives, if any, must be as approved by the Engineer.

B. Bentonite shall comply with American Petroleum Institute Standard 13A.

C. Cement: Portland Cement ASTM Type 1 or 1-S
A written certificate specifying cement quality shall be given by cement supplier for each tank load shipment of cement received.

Water shall be clean, fresh, and free from oil, acid alkali, organic matter or other deleterious substances. Contractor shall supply all the required water. Contractor is responsible for changes in the water chemistry and its effect on the slurry mixture.

Laboratory slurry mix design shall be submitted to the Engineer prior to construction of slurry trench start up.

Whenever temperatures are anticipated to be 32°F or less, suitable cover, as approved by the engineer, shall be placed over the slurry trench to prevent freezing.

Contractor shall have portable laboratory on the project.

Qualified person shall manage and operate laboratory.

At least two times per shift, tests shall be conducted to prove that mixed slurry shall meet all requirements.

Contractor shall remove all excess slurry and by-products from job site after trench completion to the satisfaction of the owner or his representative.

The Contractor shall prepare and submit the following:

1. A profile of the trench bottom and a description of the material encountered in the bottom.
2. Results on all construction control testing done to meet specification requirements for the slurry and the backfill.
3. A record of all admixtures utilized, their proportions and placement locations.
4. A record of unusual conditions of materials and construction problems encountered and dispositions made.

Measurement shall be based on the area in square feet of slurry trench measured in a vertical plane through the centerline of the slurry trench within the boundaries established by the working surface, the bottom of the excavated trench as approved, and vertical lines at each end of the approved full depth of the excavated trench. Measurement shall be based on surveys and soundings taken at the site as witnessed by the Engineer.

Payment for slurry cutoff trench measured as specified hereinbefore shall be made at the contract unit price per square foot. Such price shall include all costs of stripping, excavating by the slurry method of excavation, stockpiling or spoiling excavated materials, obtaining backfill materials from commercial quarry, mixing, blending and placing the slurry trench backfill, and all other items incidental to the construction and completion of the slurry trench. No separate payment will be made for slurry materials including bentonite, additives, equipment and mixing, handling and cleaning the slurry, cleanup, and assistance in the collection and maintenance of records; such items being included in the price for slurry trench.

The contractor shall provide a price for mobilization to the site which shall include setup of equipment and appurtenances. The exact location and quantity of the slurry cutoff wall will be determined once recommendations are given by the soil consultants.

Item No.	Items	Approx. Quan.	Unit Prices	Amounts
58	Mobilization and set up for slurry cutoff trench	1 Lmp.Sm.	$28,800	$28,800
59	Slurry cutoff trench by approved method	49,500 Sq.Ft.	2.30	113,850
60	Observation wells (approximately 20' deep)	8 Each	525	4,200
	Total Alternate 2:			$146,850

The contractor shall not include the Alternate No. 1 and Alternate No. 2 prices in the total base bid of the contract.

The contractor shall submit this addendum along with his bid documents and insert his bid prices on these sheets for consideration of Alternate No. 1 and Alternate No. 2.

ADDITIONS TO THE RECORD

Testimony for the Record

by

Secretary Michael P. Lane

Illinois Department of Transportation

on

Rebuilding of the Nation's Public Works Infrastructure

U.S. House Committee on Public Works and Transportation

Field Hearing

Matteson, Illinois

October 29, 1990

Mr. Chairman, I would like to thank you and members of the House Committee on Public Works and Transportation for holding this hearing on the rebuilding of the nation's public works infrastructure. I appreciate the opportunity to submit testimony for the record which expresses the surface transportation infrastructure concerns and needs of the Illinois Department of Transportation (IDOT).

I commend the Committee for taking a strong role in addressing the infrastructure crisis. The Committee has responded to the public works infrastructure "crisis" over the last decade, even as the general public just became familiar with the buzz word "infrastructure", through the 1987 Clean Water Act Amendments, the 1986 Water Resources Development Act, the 1982 and 1987 Surface Transportation and Uniform Relocation Assistance Acts and the 1982 and 1987 Airport and Airway Improvement Acts. The current and future work by the Committee on these programs is essential for the nation to fulfill its public facilities investment needs.

I especially want to thank the members of the Illinois Congressional delegation who serve on this Committee: Mr. Sangmeister, Mr. Lipinski, Mr. Savage, Mr. Costello, and Mr. Hastert for their efforts in representing the needs of Illinois in the Public Works Committee and in the Congress.

Mr. Chairman, we at IDOT are excited about the prospect for reshaping the nation's surface transportation policy which is currently underway. The expiration of the current federal highway program, combined with the completion of the nation's Interstate highway program, provides a unique opportunity to substantially restructure the federal surface transportation program to redirect federal resources from the past priority of constructing Interstate routes to current and future priority needs.

As you know, in preparation for a new authorization bill, major transportation interests nationwide have been active in in-depth reassessments of the future federal programs and development of recommendations to meet their needs. IDOT too has significant interest in the upcoming legislation. I am pleased to have the opportunity to share our concerns with you on highway and transit issues.

First of all, IDOT supports a continued strong federal funding component to the national highway and transit programs. Federal spending needs to increase, which can be accomplished by first spending down the Highway Trust Fund balances. Second, we believe that the federal-aid highway program does need restructuring, but needs to address national priority issues, not just return federal revenue to the states as a block grant according to contributions to the Trust Fund.

Illinois' strong surface transportation system has benefited from a strong federal program. The nation has benefited as well. With the consensus of reports that the nation is not adequately investing in transportation to meet current needs, let alone expected growth in demand, a strong federal program is clearly a good economic investment.

Highway Program Concerns

IDOT advocates that the federal program be restructured to meet the key categories of needs listed below in the next reauthorization period. Key objectives are to secure increased funding for Interstate repair and improvement needs, a new comprehensive program to address urban/suburban traffic congestion, and strong discretionary funding components. In addition, we support a strategy for closing out the Interstate program which minimizes the impact on the transition to a new, restructured federal highway program. The following are our key recommendations - some concerning individual programs and some concerning broad, overriding issues.

o Increased Funding for Interstate Repair and Improvement - IDOT supports increased funding for Interstate repair and improvement needs. The Interstate system is aging and traffic on it continues to rapidly increase, especially heavy truck traffic.

The need for repairs and improvements nationwide will accelerate and increased funding is a high priority. Federal funds "freed up" from the completed Interstate program could help to address growing Interstate repair needs.

- Expand Share of Program for Urban Area Needs - Urban/suburban traffic congestion has become one of the nation's most critical surface transportation problems. The impact of congested highways is especially severe on economic activity. If not adequately addressed, congestion will continue to worsen, significantly reducing the nation's productivity in a highly competitive world economy. Cost/benefit analysis done by the Federal Highway Administration shows that investment in urbanized areas has a significantly higher ratio for all alternative levels of program size ranging from 20% below current levels up to 30% above and even up to meeting full needs.

  To address this, IDOT is seeking an increase in the share of federal highway program dedicated to urban needs. Federal funding to improve capacity and to better utilize existing urban area roads should receive priority consideration in the next federal highway program. Specifically, we would prefer a separate urban program which would clearly focus federal funds on urban needs. To this end, IDOT advocates a comprehensive program to both increase funding for the existing Federal-aid urban program and establish a new urban highway component that would make funds available to the states for larger scale projects to improve major arterial streets and highways in urbanized areas. This approach would address both routine urban transportation needs as well as extraordinary needs such as major system management or capacity improvements. We envision such a program apportioning funds to states based on urban and urbanized population and also including a substantial discretionary component for extraordinary needs.

o Discretionary Funding - IDOT is seeking continued, strengthened discretionary program components in the next highway authorization. There are three areas where a discretionary funding component is especially needed: Interstate repair and improvement (I-4R), major bridge rehabilitation or replacement, and urban congestion relief. There currently are discretionary programs for the first two areas; they should be continued and strengthened to reflect the growing needs in these areas. For the third, urban congestion relief, a new discretionary component should be established as part of a comprehensive urban/suburban congestion program in the next highway reauthorization act.

The next federal highway authorization will likely continue to focus most of the funding resources on ongoing, routine repair projects. However, there will continue to be major, extraordinarily high-cost projects that require exceptionally large funding that cannot be accommodated with a state's regular formula apportionments. In addition, many of these projects are on heavily traveled segments in urban areas where the rehabilitation work must be done under accelerated schedules to minimize disruption to traffic. For example, a project to rehabilitate a heavily traveled expressway or to upgrade a regional arterial street to expressway standards typically causes horrendous traffic congestion in a wide corridor along the length of the project. Needs such as this run in uneven, lumpy cycles for which discretionary funding is needed.

Discretionary programs also offer a way to implement the US Department of Transportation's desire for greater participation in projects by the states, local governments, and the private sector, especially for projects to provide new capacity. While there is little broad-based support for substantially reduced federal participation for regular rehabilitation type projects, the more extraordinary projects, funded with discretionary allocations, are better suited for a smaller federal share. From the federal perspective, reduced federal project participation is a way to leverage more state, local, or private dollars. From the state perspective, discretionary funding can augment funding for extraordinary, high-cost projects for those states that are willing to commit a significant share of their own resources.

Transit Program Concerns

- Transit Factors for Distribution Formula - Should Congress consider increasing the amount of Mass Transit Account funds for formula distribution, IDOT is concerned about the formula that would be used for distributing these additional funds. It is very important that any distribution formula be based on transit needs factors to target funds to metropolitan areas, which have tremendous transit needs.

- Increase Funding for Formula Program - IDOT is seeking substantially increased federal funding for the formula (Section 9) program, which provides operating assistance and funding for routine capital projects. A decline in funding over the last five years has created serious shortfalls for both operating and capital needs nationwide. The continuation of operating assistance, especially for areas with a population under 1 million, should be a priority. Funding for routine capital projects should also be increased to deal with the backlog of deteriorated capital facilities and to ensure safe and reliable transit service.

- Increase Funding for Small Urban and Rural Program - IDOT is seeking a large increase in the size of the small urban and rural (Section 18) program. This program is authorized to receive 2.93 percent of the total formula funds. Congress has recognized that this share of total formula funds is inadequate to meet growing needs across the nation and has, over the last four years, appropriated additional funding. For example, in Illinois, the number of rural systems has increased from 7 systems in 1980 to 24 systems now. The percent share for the Section 18 program should be raised to at least the 5 percent level, to meet critical mobility needs in the nation's small cities and rural areas.

o New Starts - IDOT supports continued adequate funding for the "new starts" category in order to ensure federal funding for new transit operations nationwide. Currently, new starts is a separate part of the discretionary (Section 3) program designed to fund primarily major extensions to existing rail lines or the establishment of new rail lines. New rail systems, exclusive busways, or high occupancy vehicle lanes can provide much improved service with greater operational efficiency and reduced costs in high density corridors, relieving congested expressways. These extraordinary capacity expansion projects need a special source of funds like the new starts category.

In conclusion, there is an urgent need for the federal government to focus on the transportation infrastructure problems of this country. Thirty years ago the main purpose of the nation's transportation policy was to provide a first-class highway network for the nation's interstate commerce, for national economic development. This has been achieved and has contributed to the United States' premier position in the world economy. However, the key "transportation need" has now shifted to maintaining and improving the existing surface transportation infrastructure and preserving and improving the condition and service level of transportation in metropolitan areas. The problems of addressing transportation infrastructure concerns cannot be solved overnight...but great headway can be made in the form of comprehensive, strategic federal programs, working in concert with strong state/regional leadership. I urge the Committee to include in the new surface transportation legislation programs that focus on urban highway and transit needs and infrastructure improvements.

Mr. Chairman, thank you again for the opportunity to present the surface transportation infrastructure concerns and needs of IDOT. I wish you much success in refining and strengthening the federal role in meeting the full range of national infrastructure needs and in particular, the development of the next surface transportation legislation.

Testimony of William R. Deutsch
Illinois Petroleum Marketers Association
October 6, 1990
Regarding Future Highway Authorization Measures

The Illinois Petroleum Marketers Association has over 750 members - independent businessmen operating as jobbers, marketers and suppliers of petroleum products in every county in the State of Illinois. Their operations vary in size from as small as 300,000 gallons a year to as large as 70,000,000 gallons a year. Many of these marketers operate under branded names, others operate under their own independent names and therefore, you have the views of both the branded and unbranded segments of the petroleum marketing industry in the State of Illinois.

Many of our members are small marketers, owning tank wagons, pickup trucks, and using common carriers for the transportation of petroleum products. However, 40 percent of our marketers also own transports and pick up the product at refineries and terminals throughout Illinois and adjoining states, and transport the product to their bulk plants or directly to service stations or large commercial accounts. The marketers deliver 80 percent of the agriculture demands for gasoline, fuel oil, and diesel fuel. They also serve a large percentage of industrial users.

Eighty-five percent of Illinois petroleum marketers own or operate service stations. Today, sixty percent are self-service, and the remainder are full-service or dealer operated. Several other members either operate or own over 80 truck stops in Illinois. In addition, in the last seven years, many have entered into food operations in conjunction with service stations. These operations are known as convenience stores, and there are 2,200 operated by our membership.

An area of deep concern to our members is the proposal being circulated to modify 23 U.S.C. Section 111 to permit states to allow construction of service stations and restaurants on interstate highway system easements. As you know, Section 111 now prohibits states from permitting automotive service stations and other commercial establishments for serving motor vehicle users to be constructed or located on the rights-of-way of the interstate system. The rule, in effect since 1956, has been tested several times, and it has always held up in the courts. IPMA is concerned that legislation which might modify that provision to allow service stations, convenience stores or gasoline stations to be opened along the interstate system right-of-way might distort the competitive balance. We oppose this for several reasons.

First, additional food and fuel establishments are not necessary along the interstate system. As you know, at most highway interchanges, service stations have been constructed to serve the motoring public and generally, the restaurants, service stations and truck stops operate 24 hours per day to ensure the traveling motorist of food, fuel and lodging at all times. Further, at these interchanges, the competition for the motorist is vigorous, with both major oil company stations and marketer operated stations selling both branded and unbranded product. This healthy competition leads to lower gasoline prices and customer convenience as each motorist can select the brand of gasoline that he desires and can utilize an appropriate credit card as necessary. These road side facilities collect and pay numerous taxes to the local communities. We believe the present system serves the motorist very well.

Allowing a state to lease land along the interstate could be extremely harmful to our members and seriously undermine the investments they have made adjacent to the interstate. While it is clear that the motorist is well served by the current system of having service stations located on private land, we understand that states seeking additional revenue sources for highway maintenance and construction might consider leasing space on a highway easement as an alternative that would raise significant revenue without increasing taxes.

While IPMA appreciates the need for revenues by the states, we do not believe that destroying the livelihood or undercutting investments made by small businessmen is an appropriate method of seeking that revenue. Fuel is taxed heavily by the state and federal government. In site selection, marketers represented by IPMA have sought to provide the motorist with a convenient outlet, which often means leasing or purchasing land adjacent to the interstate. Often that land, because of its location, has commanded premium prices, and our members must sell high volumes of gasoline to recoup this investment. If a competitor is allowed to open a more convenient station on the interstate easement, he will undercut the revenues that our members depend on to pay rent, taxes and employees.

A second concern is that our members will be financially excluded from ever participating in leases along the interstate if this prohibition is removed. It is likely that if a state were interested in leasing service station space along the interstate easement, they will establish a number of sites where service stations would be built. For example, Illinois might indicate that service stations are to be built every 50 miles along Interstates 94, 94, 88, 80, 74, 55, 57, 72, 70, 40, and 24; this would represent approximately 50 to 100 stations. Illinois, in an effort to limit administrative costs may request bids from anyone capable of constructing and operating all of these stations. This is the policy of the Illinois Tollway System. If this were to occur, independent marketers who typically operate 4 - 5 service stations could not be qualified bidders, and the bidding would default to those major oil companies who are interested in operating these stations. Thus, our members with sites on interstate exchanges would be forced to watch as their competitors obtain premium sites in direct competition with them. Under no circumstances should a monopoly be given to a specific commercial operator.

The original interstate authorization act of 1956 clearly established that the interstate system would not be a commercial corridor. Businesses, including marketers, have relied on that decision to construct on interchanges and continue to make substantial investments to maintain and improve their facilities. A sharp change in the rules at this time would not be fair to these businesses who have and will continue to provide public services.

An additional problem with such a proposal relates to the Highway Beautification Act. Through the efforts of Congress, much of the interstate system is well landscaped and is free from the visual pollution of excessive commercialization, billboards are prohibited and in many cases, there are no effective means of advertising your services to the public. While this obviously has beautified the interstate system, it will create unfair competition if some service stations are constructed on the interstate and therefore, easily visible. Unfortunately, the competitors who are at the interchanges cannot use privately-owned billboards to advertise along the interstate several miles prior to their interchange and thus will remain unknown to most travelers, who in all probability will utilize the on-highway site for their fueling needs.

In the past few years, the State of Illinois has implemented a system of road side service signs. The Illinois Department of Transportation has erected large blue signs, and space is sold on these signs to commercial establishments. The signs are located on the right-of-way approximately one mile before the interchange. Food, lodging, and fuel each have panels on the blue signs. Individuals choosing to participate are charged $600 per year plus a one time fee of $300 to get the signs made. In almost every instance, the available space on all the signs along the interstates were completely sold out. This type of interstate sign program is implemented in at least 21 other states. There is certainly no need for further roadside services over and above those already provided in Illinois.

IPMA respectfully urges you to oppose any proposal to modify 23 U.S.C. Section 111 to allow commercial development on interstate highway easements in the next highway authorization bill. We thank you for your consideration of this matter. If you have any questions or desire further information, please contact Mr. William R. Deutsch, Illinois Petroleum Marketers Association at (217) 544-4609.

Record

WRITTEN TESTIMONY
SUBMITTED FOR THE U.S. HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION HEARING
BY THE SOUTHWEST COUNCIL OF MAYORS
OCTOBER 6, 1990

The Southwest Council of Mayors is a body of duly elected officials representing the 20 municipalities in the Southwest area of Cook County which consists of some 300,000 people. The Council meets on a regular basis to discuss common municipal issues which include, but are not limited to the areas of roads, bridges, airports and transit systems. Each issue in and of itself is extremely important to the continued economic well being of this area. The group has always sought to make sure the infrastructure of the area is adequate to meet the demands made on it. However; with an ever increasing burden being placed on local units of government to finance major projects, we call on the U.S. Congress to make sure monies are appropriated to assist communities in meeting these demands.

The Southwest Council of Mayors has found the Federal-Aid Urban Program most beneficial in meeting at least some of the needs of road rehabilitation, bridge reconstruction and street lighting in this area. The Council calls on the members of Congress to retain an FAU - type program in any new transportation legislation. We also call on the members of Congress to keep in place a system that has local officials selecting and programming federally funded projects. Congress must realize the dire need for increasing federal funding for urban areas. For the past 35 years, the national focus has been on funding the interstate system. We believe that with the completion of this system the focus should be on urban areas to retain mobility. This urban mobility must be recognized as a national concern because the economic vitality of our nation is dependent on it.

In addition to keeping an FAU type system in place with an urban emphasis, the Southwest Council also strongly encourages Congress to utilize any increase in the Federal Motor Fuel Tax for Highway Programs. While we recognize the need for deficit reduction, this money collected by the transportation users, needs to be returned to the transportation network. This position should not be compromised in any form. We must emphasize this point; this country has become what it is in a large part because of our transportation system. Without a commitment by Congress to maintain and expand this system, our country will fail in moving its people and goods to the market place. We hear all to often of the United States losing its competitive edge to other world markets. Failure to put MFT monies back into this country's infrastructure will only further lead to this loss.

Airports and air travel are also a very important aspect of our transportation network. The Chicago area is now considering the siting of a supplemental regional airport. The Southwest Council is in favor of a new airport as long as it is supplemental to the existing airports and not just a replacement of Midway Airport. Much can be gained from building a new airport, from keeping the Chicago area the transportation hub of this nation to increasing the employment possibilities throughout the region. On the other hand, much can be lost by closing or taking away the commercial airline traffic from Chicago's Midway Airport. The economic impact this facility has is far reaching; without it's existence, the losses associated with the closing would have regional impact.

In closing, we want to reiterate the Southwest Council of Mayors opinion on issues facing the U.S. House Committee on Public Works and Transportation:

1. The inclusion of a Federal Aid Urban type program in any future transportation legislation where the local officials select and program federally funded projects.

2. An increased emphasis in federally funded projects in the urban areas to retain mobility.

3. Any increase in the Federal Motor Fuel Tax be utilized solely for the transportation needs of this country.

4. There is a need in the Chicago area for a supplemental airport not a replacement airport.

Respectfully submitted by:

THE SOUTHWEST COUNCIL OF MAYORS

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

FRIDAY, DECEMBER 7, 1990

House of Representatives,
Committee on Public Works and Transportation,
Nashville, TN.

The committee met, pursuant to call, at 2 p.m., in rooms 12 and 14, Legislative Plaza, Charlotte and 6th Ave., Nashville, TN, Hon. Glenn M. Anderson (chairman of the committee) presiding.

Present: Representatives Anderson, Clement and Valentine.

The Chairman. Good afternoon. The Committee on Public Works and Transportation hearing on the Future of Our Nation's Infrastructure Needs will come to order.

It is a great pleasure for our Committee to be here in Tennessee today. We will be hearing testimony from an impressive group of witnesses, and I know that this is going to be an extremely productive hearing.

Before I yield to my colleague from Tennessee, Congressman Bob Clement, I just want to express my appreciation to him for his continuing leadership and valuable contributions to the Committee's efforts to address our nation's pressing infrastructure needs. And I especially want to thank him for recommending that we hold this hearing here in Nashville. It is a perfect setting for us to look at infrastructure in a rapid growth urban area of America.

During his brief tenure in Washington, Congressman Clement has quickly made his mark in the United States House of Representatives. He is known among his colleagues as a hard-working Member who has the ability to get things done. Even senior Members of Congress have taken notice of him. Shortly after his arrival in Washington, he was named to the very prestigious and important House Democratic Steering and Policy Committee. And Congressman Clement was the only freshman Member of Congress appointed to the Steering and Policy Committee during the 101st Congress.

And during his first full term in Congress, Bob managed to propose a very important piece of legislation which changed the way the Federal Government reimbursed local governments for noise abatement programs, in effect speeding up the noise abatement process by years in cities across the Nation. Very few freshmen Members of Congress have seen such major legislation adopted, a fact that President Bush even noted during a special White House bill signing ceremony held in the Oval Office.

Congressman Clement has also become rather adept at being able to secure federal funding for projects in his district and for the state of Tennessee. He was recently responsible for securing funding for a study of the effect that an earthquake along the New Madrid fault would have on infrastructure in the region and how that infrastructure could be more rapidly and effectively replaced after a major earthquake.

I personally admire Congressman Clement's dedication and obvious love for his district. If there is ever an occasion to promote Nashville, Music City, U.S.A., or Tennessee, Congressman Clement takes it. I have spent many hours in meetings and hearings with Bob Clement. And thanks to your Congressman, I know that middle Tennessee is a great place to live and work, right?

Mr. CLEMENT. Right.

The CHAIRMAN. Tennessee is the Volunteer State due to the tremendous number of troops who volunteered for duty in the World—in the War of 1812, serving under General Andrew Jackson. And Bob Clement represents the same district that Andrew Jackson represented. I know cousin Minnie Pearl used to be the Congressman's next-door neighbor when he was growing up in the Governor's mansion. Again, thank you, Bob. We are pleased to be in Tennessee.

And also with us this afternoon is Congressman Tim Valentine from the 2nd Congressional District of North Carolina. And I think it is worthy of special note that he is from Nashville, North Carolina. [Laughter.]

Tim is a respected and dedicated Member of our Committee. He serves on all three of our major subcommittees; Aviation, Surface and Water Resources, and is a Subcommittee Chairman on the important Science, Space, and Technology Committee. And this year, our Committee has been examining many aspects of the infrastructure issue, seeking a better understanding of our Nation's public works crisis. We have explored emerging infrastructure needs from the national perspective and reviewed the impact of infrastructure on private investment on the ability of the United States to compete in international markets. And we also plan to look at infrastructure financing alternatives and new technologies.

It is important, however, that we understand the kind of infrastructure problems that are being experienced at the local levels. So, we have embarked on a series of hearings at different sites around the Nation to talk with you, the people most directly involved with our infrastructure.

And let me tell you why infrastructure is a national priority. The answer is our economy. The United States ranks 55th in the world in capital investment. Japan spends five times more than we do on infrastructure, and West Germany's annual productivity rate is three times ours.

Infrastructure is not only concrete; it is competitiveness. Yet, what we see today is a system of peril and not pride. Sixty percent of our highways and 41 percent of our bridges are in need of work.

Traffic congestion has increased over 50 percent in the last ten years. In our Nation's largest urban areas, two billion hours of time are lost annually. And if you are delayed 20 minutes each day in rush hour going to work, by the end of your career, you will have wasted two working years.

By the year 2000, traffic delays caused by inadequate roads will cost us $50 billion in lost wages and wasted gasoline.

No new airport has been built in this country since 1974.

Many of our urban water systems are over 100 years old and lose as much water as they move.

And countless jobs are being lost.

Truly, this is a national problem of alarming dimensions.

And because of this, we are looking to you to help us gain further insight into our infrastructure needs. The question today is, what is the condition of the infrastructure in Tennessee, particularly in this region of the state. Are your roads, bridges public buildings, sewers and wastewater treatment plants, water supply facilities and other basic services adequate to meet current and anticipated needs of the area? And if not, what can be done and by whom?

We look forward to today's hearing to answer these and other questions.

And now, I would like to recognize Congressman Tim Valentine for any brief opening remarks he would like to make. Tim.

Mr. VALENTINE. Thank you, Mr. Chairman. I do not want to trespass on the time of the Chairman and Mr. Clement and those who have been kind enough to come here today. Suffice it to say that it is a pleasure for me to be in Nashville, Tennessee. I had a part in enriching the quality of life here when I sent my youngest son, Phil Valentine, here to work about four or five years ago. And we are here also to receive information from distinguished visitors who have come to testify and to try to tell the good people in this part of Tennessee what a splendid representative they have in the Congress in our young friend, Bob Clement. So, I will listen with interest to the testimony of witnesses and appreciate the many courtesies extended to us and hope to be back with you again soon.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, Tim. At this point, I would like to call on Congressman Clement for his opening statement and then the introduction of our witnesses. Bob.

Mr. CLEMENT. Thank you, Mr. Chairman and Congressman Valentine. We are pleased to have both of you in Nashville, Tennessee, the 5th Congressional District, or what you referred to as Andrew Jackson's district. And then someone who came along a little later than that that you and Congressman Valentine remember in Tennessee history is—well, or U.S. history—and that is Sam Houston was also one of my predecessors in this Congressional district.

The CHAIRMAN. In this district?

Mr. CLEMENT. Yes, in this Congressional district. Andrew Jackson and Sam Houston. I am Number 38. [Laughter.]

How I know that, I spoke on the floor of the House of Representatives for one hour recently, and I traced our heritage all the way from Andrew Jackson to Bob Clement. That is how I know I am Number 38.

Chairman Anderson has got an extremely successful record in public life and private life as well. And Chairman Anderson has served for the State of California in the 32nd District since 1968.

Prior to that, he was a Mayor. He was also Lieutenant Governor in the State of California and then in Congress since 1968. And as you all know, is Chairman of the Public Works and Transportation Committee.

Congressman Valentine has just got elected for his fifth term. And just as he said, he is from Nashville, North Carolina. We were talking about that earlier. There are three of us that serve in the United States Congress from Nashville. From Nashville, Indiana, Lee Hamilton and Tim Valentine from the state of North Carolina and myself.

I would like to make a few opening remarks, and then, I am going to introduce our witnesses, or I might say, the first panel.

America's infrastructure, our extraordinary system of roads, bridges, airports, seaports and inland water and sewer systems, provides the framework for our dynamic economy. Highways are the backbone of that infrastructure and the glue that binds together all other modes into a multi-modal system. But our highways are wearing out, and as are other elements of our infrastructure system. The economy's life support system is ailing and needs to be revitalized if we are to meet the challenges of the 21st Century.

A Blue Ribbon National Council on Public Works Improvements found that while the demand we place on public works has been growing, our investment in infrastructure has not kept pace. Chairman Anderson pointed that out awhile ago. This failure is limiting us today and will impose serious economic burdens on coming generations. The result of more than 20 years of under-investment in public works spending has caught up with America. We are seeing wide ranging and serious problems with our nation's public works network.

Over 41 percent of the nation's 578,000 bridges are listed as either structurally deficient or functionally obsolete. Over 62 percent of the paved roads in the United States are in need of repair.

As we know well here in middle Tennessee, traffic congestion continues to escalate. The Federal Highway Administration estimates that at current rates, by the year 2005, the nation's drivers will spend $3.9 billion annually sitting in traffic.

Regrettably, federal spending for mass transit systems has been slashed 23 percent since 1980. Yet these systems are essential to relieving urban congestion.

And the situation facing our nation's airports is also becoming critical. A Federal Aviation Administration study showed that the number of airports experiencing significant congestion grew from ten in 1981 to 25 in 1990. To make matters worse, the FAA also estimates that air travel will increase by 70 percent over 1986 levels by 1998.

These growing inadequacies come at a time when the United States is facing serious economic competition from western Europe and the Far East. Studies have shown that countries which sustain a high level of public investment relative to output experience higher productivity growth than other countries. For example, Japan—I think this was also pointed out very eloquently awhile ago—has invested about 5.1 percent of its output in public works and achieved a productivity growth of 3.1 percent per year. The United States, on the other hand, invested 0.3 percent of its output in public works and has seen a productivity growth rate of a scant 0.6 percent.

Put another way, if we increase spending on core infrastructure by one percent of GNP, productivity would rise by an estimated $62.5 billion. Certainly, if the United States is to compete effectively in the world markets, we must begin addressing our core infrastructure needs.

The Committee on Public Works and Transportation will be preparing a new Federal Aid Highway Bill in 1991. In 1992, the Committee will draft a new Water Resources Bill. Over both years, the Committee will monitor implementation of the newly enacted Airport and Airway Improvement Act. The decisions Congress is expected to make over the next 12 months on our national transportation programs will have a profound effect on American quality of life and economic growth well into the 21st Century. The legislation to be drafted will emphasize five general principles: improving the country's international competitiveness, developing local and state economies, enhancing the quality of life, protecting public safety and providing flexible, consistent and stable funding.

I would also like to emphasize that we—the federal, state and local governments—have to tie together transportation and land use planning to a greater extent. We have allowed builders and developers to put private developments down without any concern for how people get in and out. No one worries about transportation. I believe we definitely need some kind of rejuvenation of the planning process that has been on the books since 1966.

We are fortunate this afternoon to be able to assemble those individuals who will be able to give us their expert views on key aspects of our transportation system. We will hear about Tennessee's transportation problems and needs. These problems are numerous, and a new innovative approach to transportation are needed. That is why I have asked the Committee to include a panel to discuss the important role bicycling can play in complementing public transportation.

As a member of the Public Works and Transportation Subcommittee on Surface Transportation, I will be focusing my energies in building Congressional support for bicycling and to ensure that the needs of bicyclists are adequately addressed in the 1991 transportation bill. Many states and regional governments have recognized that bicycling is a very important element in a regional transportation plan. Concerns about traffic gridlock, the high cost of road building, air pollution and the increasing need of many families to trim their budgets have, in effect, made bicycling an attractive alternative to more traditional modes of travel. In addition, bicycling promotes physical fitness and health.

In the first half of the century, President Franklin Roosevelt and Congress invested heavily on our national infrastructure to facilitate the transportation of goods to market. This prudent investment in transportation enabled the United States to become a super power in the global marketplace. At this point in our history, we are at a critical crossroads. America needs to commit itself, as our forebearers did, to investing in roads, seaports and airports to assure ourselves and our children a leadership role in a global economy.

Our hearing today is a step in that direction. The Public Works and Transportation Committee will receive testimony from a broad range of interests about infrastructure needs at the state and local levels. We also examine the costs required to rebuild our infrastructure and who should pay the bill.

I look forward to hearing from our distinguished witnesses this afternoon.

Chairman Anderson mentioned awhile ago that he asked me to introduce the various people that will testimony. And we will begin with an overview of middle Tennessee's infrastructure needs.

I am pleased to introduce Representative Robb Robinson, Chairman of the House Committee on Transportation. Chairman Robinson is serving his tenth term as a representative of the 51st House District.

We also have the Honorable Emerson Meggs, President of the Greater Nashville Regional Council and the county executive in Robertson County.

Rounding out the first panel, we have Ms. Gwen Hopkins, Information Officer for the Tennessee Department of Transportation. Gwen Hopkins is substituting for the Commissioner of Transportation, Mr. Jimmy Evans, who is out of town.

Chairman Robinson, we will begin with you.

TESTIMONY OF HON. ROBB ROBINSON, CHAIRMAN, COMMITTEE ON TRANSPORTATION, TENNESSEE HOUSE OF REPRESENTATIVES; HON. EMERSON MEGGS, PRESIDENT, GREATER NASHVILLE REGIONAL COUNCIL; GWEN HOPKINS, INFORMATION OFFICER, TENNESSEE DEPARTMENT OF TRANSPORTATION

Mr. ROBINSON. Thank you, Bob. Mr. Chairman Anderson, Mr. Valentine and our own Congressman Clement, we welcome you to Nashville. We appreciate, Bob, your being instrumental in bringing this fine Committee to Nashville.

Thank you for the opportunity to address you on behalf of the citizens of Tennessee. Those of us in Tennessee who have an interest in building, upgrading, maintaining highways and bridges are disappointed that the five cent increase in federal gasoline tax has been imposed and will likely be used for other projects. We had hoped that such funds, if not used for highways and bridges, should at least be used for transportation projects, such as mass transit.

Studies have revealed that by the year 2000, unacceptable traffic conditions will prevail in the middle Tennessee area, even with upgraded and expanded highways, if a mass transit system is not in place.

Gentlemen, in the last 4 years, we have increased gasoline tax twice to eight cents—in the amount of eight cents, and that brings our total gasoline tax in Tennessee—state tax to 20 cents per gallon. This is to fund a $3 billion-plus highway system over a 13-year period. Our goal is to expand our primary system and provide access to every community in this state. We hope to attract industry and provide a better standard of living for all of our citizens. The federal increase has eroded our tax base and will likely make it impossible to further increase the tax on gas in Tennessee in the near future.

We had hoped to finish this program without additional taxes or bonded indebtedness. At this point, that seems impossible.

Tennessee has a serious problem with off-system bridges. There are well over 4,000 defective bridges in Tennessee. Many of these are in serious disrepair. The present administration has responded to this problem with a ten-year $100 million program. But, this effort will not meet our needs over this ten-year period. Funds from the highway trust fund should supplement this program and programs of this kind across the nation.

In summary, gentlemen, I would like to recommend that we distribute the federal highway funds across the nation so that the world's finest highway system can expand and be properly maintained. Secondly, that funds be available to supplement this off-system bridge program. I further recommend, gentlemen, that this new gasoline tax and any future gasoline taxes be reserved for highways and transportation projects.

Thank you, gentlemen, for the privilege of appearing before you.

Mr. CLEMENT. Okay, our second panelist, county executive from Robertson County, the Honorable Emerson Meggs.

Mr. MEGGS. Thank you, Congressman Clement. I want to say that we appreciate Chairman Anderson and Congressman Valentine being in Tennessee today. And as County Executive of Robertson County, Congressman Clement represents us, as well as Davidson County, Nashville, and we appreciate the distinguished service he renders in that respect.

I speak today in my role as President of the Greater Nashville Regional Council, which is a planning and economic development agency serving 13 counties and 50 cities in middle Tennessee. Our region has approximately 1.1 million people living in urban, suburban and rural communities.

Every few years, the Council assesses the infrastructure needs of the region as part of our overall economic development and regional planning. This year, we updated this regional capital improvements plan. Local officials and citizens in each county met with the Council staff to identify the capital improvements needed in that particular county for the next five years. Those attending the meetings were people who would have the closest understanding of the needs, including county executives like myself, mayors, planners, road superintendents, public work directors, chamber of commerce leaders, and of course, private citizens.

We looked at needs in seven different areas: housing, industrial sites, recreation, transportation, solid waste, waster and sewer and other facilities in support of economic development. The projects were almost all regional, meaning that they impacted two or more jurisdictions.

When we finished, there was amassed a list of over 800 different projects with a combined cost estimated to total nearly four billion dollars. Of course, transportation headed the list, with 241 projects, costing a total of $2.7 billion. Almost half of these projects, $1.2 billion, improve existing roads and bridges. Water and sewer was the next largest category, with over $500 million in improvements needed. Solid waste projects will cost another $95 million, almost three times what was needed four years ago when we last inventoried needs.

This study documents the need for improvements in our infrastructure. Our region has experienced strong growth, especially in suburban areas. We have strained to keep up with that growth and demands of the public. We have far more needs than resources to meet these needs.

The problems are not just limited to Nashville and the suburban communities. Many of our rural counties also face roads that limit economic growth, water and sewer systems that serve too few and pollute too much, and new solid waste disposal requirements that cost far more. We need help to tackle these and other infrastructure needs that tax our already overburden resources.

The Council is also involved in efforts to improve other forms of transportation. When one of the major railroads in this area abandoned parts of its branch lines to the outlying counties from Nashville, local governments stepped in to form short line railroads. The Cheatham County Rail Authority and the Nashville and Eastern Rail Authority have taken over rail lines that were allowed to deteriorate for years and are struggling to rehabilitate them. The work is slow. The Federal Railroad Administration and the Tennessee Department of Transportation have assisted these groups, but a lot of work remains. These rail lines are vital lifelines to many companies, and consequently, to their communities. They haul raw materials and finished products today, but may some day carry commuters as well.

To solve some long-term traffic problems, we are planning to implement mass transit for the region. Studies warn that we cannot build enough roads to meet our needs. Our land is too valuable, our environment too important, our national interest in oil too vital to continue to depend on the automobile as our first means of transportation. We have established a regional transport authority that will examine expanding the bus service from Davidson County into the surrounding counties, as well as making long-range plans for light rail service.

The bottomline, as always, is money. We have relied over the decades on the Federal Government to provide a substantial portion of the cost of major new roads. We are now bearing a greater portion at the state and local level. But we still need the Federal Government to help fund these projects.

We are continually examining ways to get more use out of the existing resources. We have operated a demonstration regional ride-sharing program for several years until a private company took it over. We were instrumental in setting up the southeast's first transportation management association in Brentwood, designed to use many strategies to reduce congestion in a suburban city.

Even with innovative programs, we still need those federal dollars. The programs mentioned today had federal transportation dollars as part of the seed funding.

We are planning for our future. We cannot and must not be short-sighted. As we strive to serve our citizens, we need the Federal Government as a strong partner in those efforts.

Thank you, gentlemen.

Mr. CLEMENT. Thank you, Mr. Meggs.

Our third speaker as part of the panel is Ms. Gwen Hopkins, Information Officer, Tennessee Department of Transportation.

Ms. Hopkins.

[The prepared statement of Mr. Meggs appears on p. 2350.]

Ms. **Hopkins**. Thank you, Congressman Clement. I am sitting in today for Commissioner Evans from my Department. He was unable to be here today, and I will be reading a prepared statement of remarks that covers several points he wishes to share with the Committee today.

Mr. **Clement**. Do you have your speaker on? I do not think others can hear you.

Ms. **Hopkins**. I can speak a little louder. Will that help some?

Mr. **Clement**. Okay.

Ms. **Hopkins**. Okay. Good afternoon, Chairman Anderson, Congressman Clement and members of the Committee. Thank you for the opportunity to address you on behalf of the Tennessee Department of Transportation on a matter of very grave concern to me and to the citizens of this state.

I regret that I am unable to appear before you in person, but I am on my way to attend the annual meeting of the American Association of State Highway and Transportation Officials, or AASHTO, which is an organization of appointed and elected leaders like myself who represent the Transportation Departments from all 50 states. At that meeting, we will be discussing a number of transportation issues and attempting to fine-tune a platform of recommendations intended to assist you and your colleagues next year as you begin planning for the reauthorization of a new national Surface Transportation Act.

As a state transportation official, I must tell you that the five cent federal gas tax increase which took effect last Saturday was a bittersweet pill to swallow. The decision to increase 1991 spending levels by more than $2 billion and drawing off some of the more than $10.5 billion that is in the highway trust fund is commendable.

But all--not half—of the five cent increase should be dedicated to transportation needs. As a nation, our highways need to be maintained. Our bridges are old and in need of rehabilitation or replacement. Even many of our interstates are rapidly becoming worn and outdated. To keep up the current system, we will need $80 billion. Tennessee is united with the other 49 states in the belief that the Federal Government should share more of the burden, spend down more of the highway trust fund monies and dedicate highway user fees to transportation and nothing else.

Tennessee has one of the highest state gasoline taxes in the country—at 20 cents per gallon. The Department of Transportation receives nearly 61 percent of those revenues. Most of the remainder goes to city and county governments. We have increased our state gas twice in the past four years—the total amount of eight cents per gallon—in order to pay for a 13-year, $3.3 billion road building and improvement program. We have highway construction projects currently underway literally from one end of the state to the other.

But that program only addresses needs on Tennessee's primary system. Our interstates are suffering from wear and tear, and especially in many of our urban areas, they are operating beyond capacity. This is happening at a time when we have seen our annual allocation of 4–R money seesaw. In fiscal 1987, Tennessee received $72.4 million. The following year, it dropped to $61.3 million. Since then, it has been creeping up slowly to our current balance of $63 million. Next year, we anticipate getting $63.7 million toward the upkeep of a little over 1,100 miles of interstate highways in Tennessee.

An area where we have seen a more dramatic pattern of funding reductions and inadequacy is our bridges. Like most other states, Tennessee's primary funding source for rehabilitating and replacing bridges is the Federal Aid Bridge Replacement Program. In just three short years, we have seen this program cut $16 million, from $50.2 million in fiscal year 1988 to $34.2 million this year.

Unfortunately, we in Tennessee know first-hand what can happen when too little funding is spread dangerously thin. On April 1, 1989, a 50-year-old bridge on U.S. 51 over the Hatchie River collapsed, claiming the lives of eight Tennesseans.

Since that tragedy, the State of Tennessee has looked for ways to shore up our efforts in bridge safety and fill in the gap left by reduced federal bridge money. Earlier this year, Governor McWherter announced a new off-system bridge program to assist local governments in the maintenance and replacement of their bridges. Our legislature approved first-year funding of this ten-year, $100 million program and it became effective on July 1. The Department let the first replacement contract under this program on August 30 in Sequatchie County.

Of Tennessee's 18,711 bridges, more than half are off-system structures. We believe that between 150–175 deficient local bridges can be repaired annually with this new program, and we believe that is a step in the right direction.

Under our Federal Aid Bridge Replacement Program efforts, we are working to systematically address needs on bridges that are too narrow and that are posted for lower load limits.

Our current budget includes $7.5 million more for contract bridge repairs, and we have hired outside consultants to supplement the work of our in-house personnel in preparing repair plans. This will enable us to let more repair contracts for bridges this year than last year.

Like other states, Tennessee has had to begin searching for ways to make up for the increasing shortfall in federal funds. State and local governments now shoulder 78 percent of this country's total highway spending, as compared to the federal's contribution of only 22 percent.

As Congress begins preparing for reauthorization next year, strong consideration should be given to providing immediate increases in Federal Aid Bridge Replacement, Interstate 4–R and every other federal aid program.

Perhaps the single most important change I would like to see in the new transportation act for 1991 is the so-called "minimum allocation" provision. As you know, this provision was included to ensure that each state receives no less than 85 percent of the money it pays into the highway trust fund. The problem is that discretionary monies, emergency relief funds, demonstration projects and such are counted against the minimum allocation apportionment. Tennessee is a donor state, meaning we pay more into the highway trust fund than we receive back through federal apportionments. When a discretionary bridge grant or emergency relief funds are counted in with our minimum allocation, it means we are not really getting our fair share. States that are not donors are not penalized in this way when they get discretionary monies.

Funds received through special grants should be in addition to federal funds we are entitled to through regular apportionment formulas. Tennessee would like to see the guaranteed minimum return to states be in the 90 to 95 percent range in the new legislation, with no penalty for any additional special funding which might be received. I have already contacted each member of Tennessee's Congressional delegation to ask for their assistance in correcting this inequity. And today, I am respectfully asking the members of this Committee to give it strong consideration as well.

The national association I mentioned a moment ago, AASHTO, estimates we will need $100 billion to meet increased demands and point us in the right direction for a prosperous future. Any further diversion of highway user fees and further delay in releasing monies accumulated in the highway trust fund deprives our nation's transportation system of badly needed revenue. Enactment of a new surface transportation act with fair and equitable distribution for all 50 states should be at the top of the Congressional agenda next year.

Thank you for your time and again for the opportunity to address you here today.

[The prepared statement of Ms. Hopkins appears on p. 2325.]

Mr. CLEMENT. Thank you, Ms. Hopkins.

Let us stay in recess for two minutes whereby we can fix these microphones where the panel is located because I know the audience is having a difficult time hearing.

[Brief recess.]

Mr. CLEMENT. We are back in session again. We got the microphone system corrected.

Now the witnesses, if you will come back, Representative Robinson, County Executive Meggs, Ms. Hopkins.

The CHAIRMAN. Thank you, Bob. And I want to thank the panel for their statement. First of all, I, too, share the disappointment of at least two of you—maybe three of you—that part of the new gasoline tax increase went to deficit reduction. I think that was wrong, and in time will prove to be counter-productive.

I remember a few years ago when we were under Secretary Drew Lewis in Washington at that time and we needed some money. And we talked about raising the gasoline tax, and it was felt that in addition to the administration going on television and the press and saying we are going to need to raise gasoline tax to be used for our highways, that each—some of the Congressmen should go in their parts of the country and make the same kind of a pitch. And each of us promised that every penny we collected in the gasoline tax was going to be spent for our highways.

And I remember out in my part of the west—I covered two or three states at least out there—and every show I was on, I urged the increase and my job was to contact other Congressmen and try to get the support for it. But we promised that every penny was going to be spent for what it should be spent for—highways, bridges, local transportation needs. And then, of course, here we ran into this situation this last year where they said let us take that gasoline tax money that you are raising and take that and pay out—put it to apply to the deficit, which kind of screws it all up because people do not mind going to the gasoline station and buying gasoline and paying some additional pennies for gasoline tax knowing that what they are paying for is going to help them with their local transportation, whether it is building roads or bridges or whatever it is. So I introduced—we introduced a resolution to counteract that. And I believe the last I heard, we had 250 of our Members—I know we were up very high. So when you get 250 Congressmen to co-sponsor a legislation to say that every penny we collect is supposed to be spent for highways, if that is what it is told it is going to be for. And so, I wanted to thank you for your statements in support of that.

Now, I do have one question which I would like to address to the panel. As you are local officials and as local officials, you are the closest in seeing the real importance of infrastructure, what is needed in your area. And incidentally, it seems to me that what I have found is that almost every part of the country is a little bit different. You go into one city, to them, this is the big thing. And it is—you are the people who know what is needed and how it should be done in your area. And given your experience what factors do you think we should consider or give priority to in crafting a national infrastructure program? In other words, how should we do it? I would like to ask you that question.

Mr. MEGGS. Mr. Chairman, the Greater Nashville Regional Council has been a part of a recent study that was initiated by the Metropolitan Transit Authority and Metropolitan Planning Commission and the Regional Transportation Authority. And we have seen congestion grow, and within ten years, the impact is going to start retarding regional growth if transportation issues are not addressed. It is estimated our travel times will double by the year 2000 and double again by the year 2015. We find that the average travel time from Rivergate Mall area, just north of downtown Nashville to the downtown area is about 23 minutes in 1985 and it will be twice that long in 1995.

So, I will add again, it just is not a big city problem. We are going to find this true in our surrounding counties, and the suburban gridlock that you read so much about in New York and California is a problem that is rapidly spreading to a lot of other places. So, regional transportation approaches to this seem very important to those of us who even live in the areas outside Nashville.

The CHAIRMAN. Any other member wish to comment on that? Mr. Robinson.

Mr. ROBINSON. We, in—by resolution, established the Regional Transit Authority, and the members of that Authority have been working diligently to come up with a plan for the future and try to find some dedicated source of revenue so that this Regional Transit Authority can function. Those folks are certainly to be commended for the efforts that they have put forth. But the results of the studies that have been made are frightening in that these transportation problems are closing in on us, and certainly, we need to take action—begin that action immediately to take care of the 1990s and the year 2000.

The CHAIRMAN. Ms. Hopkins.

Ms. HOPKINS. I would just like to say that, of course, our Public Transportation Division is involved with the Regional Authority. And so, we are fully in support of what they are trying to do and stand ready to cooperate in any way that we can with their efforts.

The CHAIRMAN. Thank you all. Mr. Clement, back to you.

Mr. CLEMENT. Okay. Congressman Valentine, do you have some questions?

Mr. VALENTINE. I do. I just want to—does this thing work? Or this one? Or maybe I will just talk louder. I want to—I share the point of view expressed by all members of the panel with respect to the diversion of part of the federal tax for non-highway construction purposes. That is the way all of us on the Public Works Committee feel, and that is the way, certainly, my officials or counterparts in North Carolina have properly schooled us, and I am sure the same is true of California.

But let me just mention a little political philosophy about that and tell you some of the reasons that I think are part of increasing the tax on gasoline and oil petroleum products was diverted to the federal fund, and reasons that I think that is a threat that we will face in the future.

First of all, the highway tax seems to be less controversial than other taxes because the price in gasoline goes up and down, and I remember within the past several years, under the leadership of a Republican governor—not to mention partisan politics—but increasing the gasoline tax was recommended to North Carolina General Assembly and passed. And I believe that I am safe in saying that the Governor and members of the General Assembly were so lucky that the price of gasoline went down, and that tax went on and nobody even noticed it.

So, I do believe that it is perceived to be a less controversial source of revenue, and it is so easy to collect. You know, you put it on and it is hard to evade. It is kind of like the tax on tobacco products. And there are some people in Congress who believe that there are legitimate reasons to spread that cost around. For example, to use some of those funds for correction of environmental problems and so on.

But I—while all of us would oppose it, I am afraid that it is here to stay. We tried to be sure that all of that money was spent to improve the infrastructure and new roads and so on, but we failed.

Just one question or two. Are there any toll roads in the state of Virginia—of Tennessee?

Mr. ROBINSON. No, sir.

Mr. VALENTINE. Is the state system operated entirely—or is the system of highways—both primary and secondary highways—financed for the whole state of Tennessee, or do counties raise money and build local roads?

Mr. ROBINSON. Go ahead. You need to answer that.

Mr. MEGGS. Well, I think we both probably could answer it. Representative Robinson is very helpful in this respect for counties in Tennessee. We have two or three different sources that are used on the local level. For example, many counties use what is called a wheel tax. Sometimes, that is used for other purposes, in addition to local bridges, roads and so forth, or to supplement funds and—you heard mention earlier about the Governor's program in Tennessee over the next ten years for bridge rehabilitation. And we participate on a matching basis in that respect. We oftentimes use a property tax as another source of revenue at the local level to supplement whatever is done through the gasoline tax.

Mr. VALENTINE. So, in the county property tax—ad valorem tax, at least in the counties, is used in part to build county roads.

Mr. MEGGS. We have that privilege and many counties do use that as a source of revenue for those purposes.

Mr. VALENTINE. So, that is a kind of reverse of the diversion of the gasoline tax, is it not?

Mr. MEGGS. Yes, sir.

Mr. ROBINSON. What—a penny of gasoline taxes in the state of Tennessee brings in about $25 million. Our present gasoline tax in Tennessee is 20 cents, and that is a half a billion dollars. About 60 percent of that, or $300 million of it, goes to the state and is used by the state. And approximately 40 percent, or $200,000—$200 million of that goes to the counties. There is some supplement there, but for the most part—for the most part, the roads in the county are funded by that state tax. Now they—some counties supplement it and have federal roads, of course, as a result of that.

But, I think that the reason that gasoline taxes are as well accepted—no tax is received very well—but the motorists of Tennessee feel that gasoline tax, if it is being used for highways and transportation projects, that their money is going into an area that they are responsible for. Now there are other ways, I think, to take care of environmental problems. They can use the automobile registration as a way. A tax on the automobile itself. But I feel like that—and the people I represent feel like—that the money that goes into the gasoline tax should be spent on highways and transportation problems. We do not feel like—we are not sure that that is going to cover the cost at this point. But we feel like that every bit of it should go back to the people in that form, and they will accept it.

Mr. VALENTINE. You can see that tax spent. You can see people scraping the roads. You can see them resurfacing. One more question. In the state of Tennessee, are there other sources of revenue where the money goes directly for the construction of new roads or improvement of roads or building bridges and other parts of the infrastructure, such as the registration fee for automobiles, the issuance of license plates and driver license reissuance or other areas. And finally, do you utilize borrowed money to any extent? Do you have structures that are built as a result of a bond issue?

Ms. HOPKINS. To answer the first part of your question, primarily, our roads are funded through gasoline tax revenue. We also get a portion of vehicle registration and some of the diesel—other motor fuel type revenues that are collected in the state. We currently have some projects that are finishing up that were funded through bond authorization, but we currently have no bonds that are currently outstanding at this point. It is all through collected revenues, primarily being the gasoline and motor fuel taxes.

Mr. **Valentine**. Thank you.

Mr. **Robinson**. Mr. Valentine, we in the legislature decided several years ago that we were going to be ready if any available funds were provided in Washington. And we passed legislation to authorize bonds. Many of those bonds were never sold, but we had them sitting over there in case you folks wanted to turn lose of some money, we were there ready to grab it.

Mr. **Valentine**. Let me ask you just one more question. We all are tied to and I guess a product of our own experiences, do you have anything in this state similar to what—in North Carolina, we call the Powell Bill money. A part—a fraction of all money collected by the state of North Carolina for highway purposes based on some formula goes back to the cities and towns to build streets. Every incorporated village in that state gets a little bit. Some are even down to just a few hundred dollars. Do you have anything like that?

Mr. **Meggs**. Yes sir, Mr. Congressman. A portion of the gasoline tax, as has been said earlier, is distributed among cities and counties across Tennessee on a formula basis, and that is where much of the local monies are utilized for local roads that are not a part of the state system as such. But, we do have that. But the part I mentioned earlier about wheel tax and property tax and so forth, is in addition to or supplemental to those funds. But the major part of it does come through that source.

Mr. **Valentine**. Thank you. Thank you, sir.

Mr. **Clement**. I also want to comment on what was said earlier about the gasoline tax because the vast majority on the Public Works and Transportation Committee felt very strongly that there should not be any increase in the gasoline tax, unless it was applied totally toward improving our infrastructure in this country. And as you know, when it was first proposed, it was 12 cents. Then we tried to get it to zero. And then, it went to five cents. And many of us were very displeased about that.

I would also like to comment—I know, Mr. Meggs, you commented about the solid waste infrastructure. And I know Robertson County has really done a good job when it comes to solid waste. And I would like for you to expand on that for a moment, and then, we will get to the next witness.

Mr. **Meggs**. That is a growing problem, as all of us aware of, Mr. Clement, and we appreciate your concerns. But the Tennessee General Assembly passed a bill in 1989 that required the state to complete a state solid waste plan. And this is going to be introduced in the General Assembly this year. And one of the things that we find, of course, is that we are just like everybody else, there is a tremendous volume being produced at a local level.

But Tennessee has adopted new landfill regulations modeled after EPA's proposed subtitle D regulations. It has been estimated it was going to cost local governments about $150,000 or more per acre to meet these regulations in land filling, and it is probably going to be somewhere in the neighborhood of $20 million annually. The state plan is supposed to require the counties or a combination of counties to prepare their own individual plans and set a goal of reducing or recycling about 25 percent of our waste by 1994. Local governments in Tennessee will have a heavy load to bear in solid waste management. It is evident everywhere. But we feel that this issue is one of national importance, and as a public infrastructure, deserves more attention than it has been getting from the federal level.

For example, we need a firm national policy on packaging and directing at the head of the stream, so to speak, a comprehensive policy for waste management and biodegradable products, recycled products and so forth. And it is going to be very beneficial if we can get some direction from the federal level in helping us on the local level to find it more manageable because we certainly cannot from the local level direct those particular aspects of such a policy.

Mr. CLEMENT. Thank you, Mr. Meggs. Thank you all. Appreciate your participation in this panel today.

Mr. MEGGS. Thank you, gentlemen.

Mr. CLEMENT. Next, I would like to introduce the Representative of the 66th District of the State of Tennessee, the Honorable Gene Davidson. Representative Davidson was born and raised in Robertson County. He is currently the Chairman of the House Education Committee. And Mr. Davidson will testify on rural issues. Please come forward.

TESTIMONY OF HON. GENE DAVIDSON, REPRESENTATIVE, TENNESSEE HOUSE OF REPRESENTATIVES

Mr. DAVIDSON. Mr. Anderson, Congressman Valentine, Congressman Clement, it is good to be with you today. I represent the area of a former Congressman by the name of Joseph Wellington Burns, who was speaker of your august body in the early 1930s. I am a resident of Robertson County, which is a county adjacent to metropolitan Davidson County. During my tenure in the General Assembly, I have seen the area which I represent emerge from a rural county to now a suburban county.

The needs of the area of Robertson and Cheatham Counties of which I represent have changed over the years quite dramatically. With growth, we have faced new challenges, as you can quite imagine. Some of these challenges we have been able to handle, while others, we as an area have not been as successful.

Our area infrastructure has to be improved. Over the years, we have tried to bring about improvement to this. But there are areas of the district that I represent that are stymied by the fact that they cannot afford to implement sewage systems on a first-time basis or expand existing sewage systems which are now antiquated. The same is true of existing water systems that cannot handle the growth that is coming out from metropolitan Nashville. And as I speak of that, I am talking about Robertson and Cheatham Counties. But also, this would be true of all of the bedroom counties around—in and around Davidson County and also those that even branch out farther from our respective counties.

Our local governments and the state can only afford a limited degree of expansion because of the demands that have arisen due to growth and transferred responsibilities, which the state has had to assume and local governments have had to assume. In addition, environmental legislation, while although beneficial, has placed new financial burdens on infrastructures.

In a case in point, a small municipality in the district which I represent supplies probably 1,000 people—customers for water usage. And recently, they were ordered or placed under a mandate to implement a flushing system whereby the water or the residue from the treatment facility before it could re-enter the stream from which it was drawn had to be purified and, in essence, the water was more—was pure more so when it was going out than what they were actually taking in. This amounted to over $100,000. In essence, it was money that had to be tacked on those individual ratepayers. Plus, in addition to this fact, they must meet the expanding need for water.

Transportation. Transportation is without saying perhaps the most important link that we all have to the rapidly changing world today. And I think that each of us face that in our respective districts, and I am sure that you do in yours. Our state has tried to improve the highway system all across this fair land. As you well know, it is a timely and costly proposition. In many instances, our efforts have been behind development, especially in the rural areas and the suburban areas.

Highway development in the district that I represent has run into many obstacles. Most of those obstacles were, in fact, due to the relocation of portions of existing infrastructure, such as water lines and sewer lines, whereby they had to be removed in order to place an—to improve an existing highway. The local governments could not afford to relocate these systems because of the cost. And to further compound the problem, there was the absence of a structure in place to help iron out the difficulties of state versus local conflicts, state versus federal conflicts and also local versus federal conflicts. It was a "take it or leave it" proposition, and these communities would have to be in a position to be ready to assume those financial responsibilities or face the task of losing that project, which in fact, was—or could be beneficial and would be beneficial to their area.

We in the outlying areas are also faced with the problem of a coordinated effort to link the highway system as far as improvements with the larger metropolitan areas. With the larger cities faced with their respective traffic flow problems, there has been little initiative on the part of large metropolitan areas to join in a united effort with satellite areas to address the needs of the outlying suburban areas in making access easier.

A case in point in the district in which I represent is Highway 431: The highway was improved on a two-lane system. Actually, it is about 12 miles long. It connects to an interstate from the county seat of Robertson County, Springfield. The road was improved to the Robertson County line and stopped there just short of the Davidson County line, due to the fact that we were unable to get activity or interest from the Davidson County sector. So, in essence, we were land locked in that respect.

We in the areas surrounding Davidson County recognize the need for a northern beltway around Nashville linking Interstates 40, 24, 65 and then back to 40 on the east. All of these arteries today are heavily traveled and all end up at square one, which is Nashville—which is in Nashville, thus creating a bottleneck here in the city. The situation is terrible today, and as you have already mentioned previously, by the year 2000, it will be a disastrous situation for our geographical area here unless something is done to correct the problem.

The project I-840 is too costly for the state to take on alone. In this situation, we must have some federal assistance.

In summation, I bring to you for your information two points already alluded to in my statement. First, we need assistance and advice in coordinating projects. I do not think that this would be a costly item, but it is something that needs to be done from the point that we began the developmental stage up to the point of actual construction. And second, we need federal assistance at least at the current rate of funding. And we all would appreciate more, but we certainly I do not think could stand any cutbacks in our areas. Without it, our existing infrastructure will crumble even further and new programs and projects will die on the vine, as well as communities.

I know of the budget woes that you face in Washington. However, the money that you spend on the highway system in this country equates into more jobs for developing communities. As you well know, more jobs equates into more tax revenue.

I thank you.

[The prepared statement of Mr. Davidson appears on p. 2317.]

The CHAIRMAN. Thank you, Representative Davidson. One question, I think, is what do you see as the major highway investment needed to stimulate the rural economy, and how important is general aviation and the condition of aviation facilities to economic development in the rural areas of Tennessee?

Mr. DAVIDSON. First of all, in Tennessee, as was mentioned in earlier testimony, we have begun a road program in Tennessee to try to link up or hook up the rural communities across this state. And as was already mentioned, it is a pay-as we-go program, which has some problems in the fact that it is a little bit slow, especially with the growth that is coming in. But, we have—we are identifying or have identified major problem areas across this state, especially in the rural areas and we are trying to put in links in there by transportation by a better highway system, whereby those communities will be linked with larger areas or even into interstate areas whereby they will have accessibility.

Now, a respective area in northern middle Tennessee—of course, in southern Tennessee today, there is the ongoing construction of a beltway around Nashville there. That links a lot of the outlying county seats or high growth areas. It does take some of the traffic congestion away from Nashville and downtown Nashville. And also, it allows those cities and those areas a chance to expand. Not only do those areas expand in and around the beltways, as we have seen, but it goes out even farther from that and serves basically, if you please, as a magnet whereby other areas even in close proximity to those beltways begin to grow and begin to fill the growth pattern there. And so, therefore, it spreads it out somewhat.

In the northern area, that is what we have tried to address with the challenge of I-840. This would link major cities, the cities of Dickson, the cities basically of Clarksville, Springfield, Gallatin and then back over into Wilson County with Lebanon and down into Murfreesboro, which in essence, would create a circle around Nashville to stop some of the heavy traffic from coming in here. It would also allow growth into the outlying areas with manufacturing where they would have accessibility to shipping.

With respect to as far as the airports in the area, of course, I think we can all attest to the fact that with the hub location here in Nashville here today by American Airlines, that this has actually generated activity within the area. Not only within Davidson County, but within all of the surrounding area here, and we are very—we are all very grateful for that.

And the satellite communities in and around Davidson County, there are small airports located there. And I know, for instance, in Springfield, the area that I represent, we have an airport located there. Today, it is an industrial tool.

And if I can back up for a moment and explain that. Over the years, with the creation of this airport, many people felt locally that it was a playground area for those who would who go out and play with their planes on the weekends—the weekend flyers and those who were training in aerobatics. As a matter of fact, in this one particular airport, the U.S. Olympic team has trained there over the years. And so, it had, I guess, the stigma attached to the fact that it was a playground area. But today, I think that has changed greatly.

It has changed due to the fact that industry in coming in and scouting the area, one of the first things that they ask for is what—do you have an airport. And if you do, how long is that air—how long is the runway? What type of facilities do you have at—on site? And due to that, we have increased the footage of the runway now to 5,000 feet, which we actually need to increase it even more to roughly a 6,000-foot area. But it serves today as a business tool. I think that it has been beneficial in drawing industry into the area. They utilize it, and I think that even with expansion of it, we can expect even more things to come. One of the reasons why we would need to have it expanded would be particularly for air freight.

The CHAIRMAN. Mr. Valentine.

Mr. VALENTINE. Do you know what part of the money which the state of Tennessee pays into the Federal Government which is marked for mass transit—do you have any idea what part of that you—what percentage you get back? Well, that—well, let me just tell you a sad story that I—maybe might justify some checking into in the state of Tennessee because I do not believe you would be that much different from the state of North Carolina.

With all of the economic problems that we have in our state and the relatively low per capita income and that sort of thing, for every dollar that the state of North Carolina pays into the federal mass transit fund, we get a nickel back. So, in addition to all of the other problems that we have, the effect of states that have high rural populations—for instance, in the southeast and out west—is that we are actually helping to finance the subway system in New York City and other metropolitan areas. And I would suggest that you might want to check into that and see if you can give some assistance to those of us who are going to try to change that situation.

You talk about donor states and you talk about getting back less than what you paid in. And my state is in a similar situation, but that mass transit thing is really a catastrophe. And of course, what they say is that it is based on what the Federal Government says is mass transit. You know, it is a rail system, and I am not suggesting that North Carolina or Tennessee needs to have a subway system around. But there are all kinds of mass transit. That is something you might want to give some thought to and contact Bob Clement and others to see if we cannot get that changed.

Mr. DAVIDSON. I appreciate that. I was not aware of the fact that that much was going to other areas, and I did not mention the fact that we do have commuter problems in the surrounding areas. That was mentioned earlier, but it is a major problem in the outlying areas, and I know that it really adds to the congestion here in Davidson County. I also realize the fact that it does add to the pollution problems that they have here.

Mr. VALENTINE. Thank you, Mr. Chairman.

The CHAIRMAN. Bob Clement.

Mr. CLEMENT. Well, I wanted to expand on what Congressman Valentine said, according to your testimony, Representative Davidson because I am very interested in mass transit. We sure ought to be treated fairly on a national scale for many of those dollars to return to the various communities across this nation. Most of our growth in the middle Tennessee area has been outside Nashville to the contiguous counties that have had tremendous growth.

And that is why I am very interested in light rail. I am very interested in an improved bus system. I am very interested in what you heard earlier about bicycling or bicycle paths. I live, as you all know, in DC, as well as here. And I live out in the Virginia area, and those beautiful bicycle paths that follow the Potomac on into Washington. And I would like to adopt those for the Nashville area to bring about cooperation for the rural counties, as well as Nashville and work in concert to make great things happen.

I know we have been working recently on Amtrak, as a lot of you know, to have Amtrak service once again to the Nashville area and the possibility of a new route from Chicago to Jacksonville, Florida through Nashville through Chattanooga to Atlanta. And knowing full well that by 1996, Atlanta is going to have the Olympics and try to use that as a target date to bring about Amtrak railroad passenger service for our area that we once had. I know as a boy, I traveled on a train all the way from Nashville, Tennessee to L.A. and back, and I miss those days. And I used to be, as you all know, with the Public Service Commission. I was on the National Railroad Committee, and so, I am a railroad buff when it comes to rail service and rail passenger service. And we need to really look seriously at ways we can improve our mass transit system because that truly is the future and for the next century.

And Representative Davidson, I appreciate very much you participating in this panel.

Mr. DAVIDSON. Thank you, Congressman Clement. We appreciate you all being in Nashville today. Thank you.

Mr. CLEMENT. Thank you.

Next on the agenda is Mr. Peter Heidenreich. Peter is the Director of Public Works for the Metropolitan Government of Nashville and Davidson County, and he will testify on local infrastructure needs.

TESTIMONY OF PETER HEIDENREICH, DIRECTOR OF PUBLIC WORKS, METROPOLITAN GOVERNMENT OF NASHVILLE AND DAVIDSON COUNTY

Mr. HEIDENREICH. Chairman Anderson, Congressman Clement, Congressman Valentine, I appreciate the opportunity to come before you today. I certainly wish I had a dollar for every time the word "infrastructure" has been repeated in the last year. We may have a financial solution to the problem that faces us.

The Governor of Tennessee has announced that next month, there will an infrastructure conference for the State of Tennessee for managing environment quality. Infrastructure is indeed—and the problems that go with it—are indeed ubiquitous, and I think you will hear—you have already heard part of this day—the many problems that we have.

We have Federal mandates that are demanding clean air, clean land and clean water, safe transportation, among a variety of other things. They put tremendous financial demands at the local level. You know what the issues are, and competition for dollars is no less fierce at the local level than it is at the Federal level. The issue with infrastructure here in this metropolitan area and areas like it all across the country is that we have limited infrastructure dollars. The competition is indeed fierce, and we are beginning to experience the fact that we cannot perform in the manner that you, the Federal Government, would like us to or require us to and still be reasonable with the taxpayers in this area. They are all competing for the same dollar.

My suspicion is that as we have spent large portions of our local resources for transportation, roads and bridges, that dollar will shrink as we have requirements to spend it on cleaning up sewage, storm water, burying our garbage, recyling our garbage and doing other things that are absolutely imperative. Building prisons is part of our infrastructure. These are things that we cannot get away from. My point is that you need to be very conscious of that. And our ability to respond, participate or even share in current programs, I think, is severely limited.

I would urge you when you leave this building today to look two blocks to the southwest. You will see our tax dollars in action as a viaduct across the railroad is being rebuilt. That is an 80-20 match—80 percent from the Federal Bridge Replacement Program and 20 percent local dollars. That bridge is being replaced because of existing programs that work. I would urge you to look to the east as we cross the Cumberland River at the Jefferson Street Bridge, which will be completely replaced, hopefully, beginning next year, again, under the same program.

Now, those 20 percent contributions by the local government were there because we had the ability and the vision to set aside that money some years ago. If that program was not there either because we could not support the 20 percent or you the 80, these two gateways in and out of Nashville would be closed. We would be unable to provide safe, reasonable transportation corridors for the people who use this city.

Those, I think, are very real and dramatic and touchable projects that demonstrate the importance of the kind of relationships we have now. We cannot afford to go backwards one penny with those existing programs. And you will hear over and over again about other needs that go far beyond these basic maintenance functions which we are performing. I would urge you to look favorably upon not only having this bill remain in place, but to consider at all costs improving it and looking at areas, Congressmen, like you suggest ofrail, mass transit and alternative means of transportation which has to be a part of an overall plan.

Safety is my biggest concern. At the local level, I am responsible for the maintenance of the system—2,200 miles of roads, 264 off-system bridges. And when the phone rings at night, it concerns me that perhaps we have been unable to provide to the citizens of the community reasonable and safe pathways to drive on and to walk on. That concerns me a great deal. We have closed bridges in the past because the resources were not available. We face that same option in the future. And I think we owe it to ourselves to at least have a system that is reliable.

The local government here has taken initiatives which I think we are very proud of. In the last 8 years, 25 percent of those bridges that I mentioned have been replaced with local money. We have taken it upon ourselves to go into debt with general obligation bonds and meet those requirements. Fifty percent of our road systems, over 1,000 miles, has been resurfaced in the last 8 years. But our ability to provide that money in the future is severely damaged by the other infrastructure needs that are pounding on our door. And if we cannot find relief in other areas, I do think—believe—I do, indeed, believe that the kind of problems that we are going to face will jeopardize public safety. And I urge you to keep that in mind as you go through these hearings and how sensitive it is to the person at the local level.

The CHAIRMAN. Mr. Heidenreich, what do you think the Federal Government should be doing to assist local municipalities?

Mr. HEIDENREICH. It concerns me when we have regulations imposed on us—let us take for example the Clean Water Act, which was just promulgated about 14 days ago. We have a permitting process to get a permit that will cost the metropolitan government of Nashville over a half million dollars just to apply for the permit. The financial consequences of that application could range in the neighborhood of $15 to $20 million annually spent within this county to try and maintain and improve a system that deals with water quality for storm water only. This is not to mention the treating of our drinking water or the treating of our sewage.

Now, no one will argue that it is imperative that we be concerned about our water quality. But as these rules trickle down to the local level, only the rules come. There is no financial assistance. There is no help for us to help provide these services, which we all indeed believe are important.

Solid waste is another issue as we face demands and requirements to do certain things. Twenty-five percent of our waste stream should be recycled. I believe that is going to be very difficult without national legislation that addresses packaging issues that assists local governments and state governments in trying to cite facilities that can deal with the problem.

There is a great deal of frustration not because of the quality of what we are being asked to do, but the capability of us to fund those kind of things in a timely manner.

The CHAIRMAN. You mentioned a moment ago the problems of clean air and things like that and how much that costs, too.

And we will—we are going to continue to see local governments, local areas do certain things and possibly get laws passed statewide, federal wide and so on. But by the same token, we have to do something about it. I remember one of my toughest fights has always been trying to build a highway with clean air above it because when you bring automobiles in or whatever you bring in, you start polluting the air because an automobile pollutes the air. And so, we do have these kinds of problems. I just wanted to hear what you thought.

Mr. HEIDENREICH. The issues are very complex, and if we treat each of those issues which commingle very quickly as equals, then we need to provide equal resources to deal with them. And we cannot play favorites and say well today, air quality is more important than solid waste or because a bridge fell down, all of our resources suddenly are going to go to bridge maintenance and away from other important areas. The way to achieve this is going to be very painful. And it is going to cost a lot of money. And we need assistance at the local level to try and find those resources to implement those very important programs. And in all honesty, it gets a little lonely when you look up the stream and we feel that we are over-regulated and under-funded to try and deal with them.

The CHAIRMAN. You mentioned bridges. A couple—2 or 3 weeks ago, I had to go to New York where a man was driving his car with his wife under a bridge. As he was under the bridge, a big hunk of concrete about the size of an automobile fell down, crushed the car and killed them both. And I was called up there to show me that this is something that, again, is a brand-new issue. You know, there was a time, wherever we built a bridge, you knew when you poured concrete, you had to put steel in there. And of course, when you put steel in concrete, you have to paint that steel with a paint that can keep the problems—the water will get in there and rust it. In New York, they say that is how it rots the steel. I call it rust. But then, we found out that these people had painted it with a paint that would have been good, say, in Chicago. But because there is a different kind of moisture in New York, there is something in the moisture—I suppose when you talk about moisture, you are talking about the water that is in concrete. But, you are also talking about the rain and fog and everything else. There is a different kind of moisture than there is in Chicago. And even though they painted it with a paint that would have kept the rust—kept it out in Chicago, when they painted it in New York, it did not do. And apparently now, they have got a bunch of bridges that are in danger up there because of this problem.

It is something we are going to have to learn when we are building a bridge now, is to find out what is in the water and the moisture in that area when we—before we build a bridge. And know that New York is probably different than Chicago. Perhaps that is even different from something over here. Perhaps that is even a different type of paint than we use in California. But we are going to have to find that out somehow. And by the same token, we are still going to have—we sure do not want these bridges falling down killing people.

Mr. HEIDENREICH. I think you are absolutely right. I think the new standards and the new technology would have to be included in our pursuit of finding reasonable ways to do that. And I know we rely heavily on the—on DOT here in Tennessee to provide us with technical expertise in testing and bridge inspection, and they do quite a good job of supporting local governments in that respect. And I think that as we learn more about the physical qualities of the materials that we use and better ways to do it, we will be able to provide structures that last longer and provide more safety. That requires an investment in research and development and engineering, and that again costs money, but I think that would be money very wisely spent.

The CHAIRMAN. Mr. Clement.

Mr. CLEMENT. Thank you for elaborating on some of the issues. And as you know, we are going to have the highway reauthorization bill next year, and that is going to be a great debate. And I am going to surely need some input from you and many others about the direction that we move. I know I mentioned the bicycle paths awhile ago. Is that something that could be looked at seriously for Nashville? Is it a feasible option for us?

Mr. HEIDENREICH. You know, I do not think bicycle paths are a great deal different than corridors for any kind of mass transit. At issue is, I think, recognizing the fact that perhaps not today, but certainly tomorrow, we will have to reserve portions of our landscape to carry people in a different mode of transportation than we do today. And whether it is bicycles or light rail or both of them in the same corridor, the fact remains, we have probably done a poor job of going out and capturing that precious land in the proper places so that we can achieve that when it is absolutely essential. And I think that planning mode and that recognition of a coming problem is of primary importance. And it is probably almost too late now to begin, but every day that passes, we lose opportunities to capture corridors that will serve us in the future. And I think it is imperative that that search begin immediately.

Mr. CLEMENT. Well, as you know, a study came out not long about Tennessee being one of the most unhealthy states when it comes to people being overweight. So, I am looking for ways through the Public Works and Transportation Committee—now, Chairman Anderson is looking at me. I want him to know, I have lost 13 pounds since I have been in the United States Congress. I think it is because of where my office is located and how far I have to walk to vote. We cannot vote in our offices. We must be on the floor of the Capitol to vote. I guess after you get a little seniority you get closer and closer to the Capitol. I believe it works that way.

Any closing comments?

Mr. HEIDENREICH. I certainly appreciate the opportunity to appear before you and perhaps make a contribution. The local level is certainly where the rubber meets the road, and it provides a great deal of feedback and excitement. And hopefully, these comments have been helpful to you.

Mr. CLEMENT. Thank you.

The next to testify on infrastructure's impact on international competitiveness is Dr. Mark Abkowitz. Dr. Abkowitz is the Director of the Vanderbilt Engineering Center for Transportation Operations and Research and holds an appointment as Professor of Civil and Engineering—Environmental Engineering at Vanderbilt University. And Chairman Anderson and I were sure pleased to have the opportunity to participate at Vector earlier today at Vanderbilt University.

TESTIMONY OF MARK D. ABKOWITZ, PH.D., ADMINISTRATIVE DIRECTOR AND PROFESSOR OF CIVIL ENGINEERING, VANDERBILT UNIVERSITY

Dr. ABKOWITZ. Thank you, Congressman Clement. Mr. Chairman, you have me feeling a bit guilty here in that we did not serve a low calorie lunch. But, I hope you will excuse that, not knowing what your intentions were at the time.

I am here representing an organization that is affiliated with the University, and yet at the same time, our specific mission is to work very closely with government and industry on transportation issues. As a result of that, I believe that I can bring to this session today a broad perspective with no particular interest in representing one viewpoint or another. And in doing so, I believe that I would like to supplement my written testimony by focusing on two or three items that I believe to be critically important and should take the center stage for my time in front of you.

We believe that the problem of transportation infrastructure has been clearly defined. It is coming out through the dialogue that you are sponsoring, as well as from a number of other people who are involved in the transportation profession. There is no question that transportation is a major part of our economy. There is no question that we have an infrastructure deficit. And there is no question that this is damaging our international competitiveness. Therefore, it seems to me that what we need to focus on is not so much the problem, but the solution.

Now, you have many people who have been participating in this process who are far more expert than I on the needs in the construction area and the financing area. I would like to reserve my comments to talk more about what the international picture looks like and how our competition in other countries are able to achieve the kinds of successes that have drawn our concern. I think the focus on all of that is to look at the process. If you look at the Japanese or the West Germans or some of the other countries that are investing more in the infrastructure or moving more readily in terms of measured success with productivity gains, they are really looking at the process. And when we think about the process and we try to translate it back into how we can perhaps improve the way in which we can go about transportation infrastructure management and rehabilitation, there are three things that come to mind, in my opinion.

The first one is management. We have to be cognizant of the fact that transportation is a management problem. And as a management problem, we have to look at it from the standpoint of not just new construction, but how do we manage what we already have as effectively as possible? Mr. Chairman, at lunch today and in published remarks that I have read of yours before, I think you were able to enumerate just how large the infrastructure deficit is. We are talking about hundreds of billions of dollars. I think it would be unrealistic of us to assume that new construction or construction techniques alone are going to be able to solve this problem given the major resources involved. So what I am here to advocate is that we look at this from a broader perspective and we look at construction, perhaps, as a technique of last resort and we look at some of the new technologies that are available from the management standpoint and we blend those technologies with the construction side. So we come up with the most cost-effective use of our resources.

The communications technology that is available today, advances in computing, and a number of other things related to this in terms of geographic mapping give us an opportunity which I believe is unsurpassed in terms of recent history to start making major advances in that area.

The second major element that I would like to stress today is the process of partnerships. If you look at some of the other countries which we consider to be our economic peers, they are very successful in managing partnerships between academia, government and industry so that we are able to bring—or they are able to bring to the table resources and a collective wisdom that is able to take the parts and make them greater than the whole. They have the entrepreneurial aspects folded in with the resources, folded in with the policy. And as a result of that, they have been able to achieve major gains at a time where in the United States, I believe more often than not, we see the same groups working on parallel streams.

The final point that I would like to make is the process that is involved in strategic planning. I think there is no question that we need to devote greater attention and resources to transportation and its infrastructure. What concerns me to some extent is how we implement that. And the strategic planning process is something that has been very successfully achieved in other countries whereby the long-term planning and the actions that are developed to support that long-term planning are done on a basis that involves a large sector of the business, government and local community. And in many cases, this means not transportation professionals interacting with transportation professionals. We need to have a broad-based input to this process whereby people in the real estate industry, people in education, the environment, transportation and other impacted sectors can all sit down together to look at their objectives and to look at how they can help each other out to achieve a common good.

So, I believe that the process is something that we need to consider, in addition to the resources and the specific investments that we are looking at in the future. And I hope that we can work out a policy that is able to effectuate that. Thank you.

[The prepared statement of Dr. Abkowitz appears on p. 2303.]

The CHAIRMAN. Dr. Abkowitz, during hearings earlier this year, we received testimony from economists—Dr. Aschauer for one—which tied the drop in public spending for infrastructure to the drop in the United States productivity growth rate. And that this could cause serious problems with our international competitiveness and chronic trade deficits. And with that in mind, if we were to craft a national infrastructure program or policy, what practice do you think we should consider to aid in promoting economic growth, productivity and international competitiveness?

Dr. ABKOWITZ. Well, Mr. Chairman, first, I would like to second the viewpoint that you just expressed. I think there are statistics that are starting to emerge which demonstrate this. For example, the United States, I believe is 55th in recent statistics measuring productivity gain, and that is certainly not a position that we are comfortable with or that we are used to being in.

The CHAIRMAN. That is awful. I remember when I was growing up, we always thought the United States should always be, you know, first or second or third or fourth. But to think that we are 55th, it is almost—that is almost at the bottom, it is terrible.

Dr. ABKOWITZ. Well, I concur, and I think the question is, how do we get back on our feet and get back into a position that we are used to being in. As I mentioned before, I think it is a multi-faceted approach. We have to look at technology, particularly the communications environment. Decisions that are being made related to manufacturing and distribution are being made with regard to the international playing field. It is no longer a question of the domestic economy here in middle Tennessee or even in the United States as a whole. So we need to start thinking in terms of trade patterns, what the typical trade patterns are in the world. I think we are all well aware that Pacific rim activity, as well as activity in the European community, is going to change and that is going to have a top-down effect on the way in which we want to position ourselves. We have to look at technology related to those trade patterns. We have to look at education.

For example, we are retiring a work force that has been trained to build because of the major capital campaigns that we had in the 1950s and 1960s. We need to retrain people in the work force now and we have to train a whole new generation of transportation professionals that focuses on managing and being able to grasp at the initiatives that are in place now for the betterment of our country.

The CHAIRMAN. Bob.

Mr. CLEMENT. Doctor, I wish you would expand on what you mean when you talk about strategic planning as a mechanism for stimulating economic activity.

Dr. ABKOWITZ. Okay. I would like to do that. Thank you. In fact, I would like to use as an example some of the activities that we are embarking on here in the greater Nashville/middle Tennessee area. When you look at the new playing field—if you want to call it that—we have to start thinking about how middle Tennessee or any other economic region can provide an attractive infrastructure to business and residential life. And when you think in those terms, you have to start looking at how the rail and barge and air and water transportation, as well as personal transportation, come together to provide a complete portfolio of positive service for the area.

In the past, I think here in the United, States, we have been too concerned about competition, for example, between modes. And it has always been a case of my barge company versus your railroad versus your truck. I think we need to depart from that. We need to start thinking about the different organizations that serve this area and to what extent they can offer a portfolio of services to make this area more attractive than some other area.

So the concept behind strategic planning is that we start in the infancy of this process and bring together a lot of different interest groups that all have a stake in the transportation arena and get them to try and be candid in expressing their needs, their concerns, their weaknesses, their strengths and try and put these together on the table in order to put together a blend of future plans that really meets everyone's needs and is formed by essentially getting everyone's resources and commitments behind the same mission, rather than everyone focusing on their own little empire.

Mr. CLEMENT. What do you think about telecommuting? I know more and more people are utilizing that term about operating from home and conserving energy. Is that going to happen, or what do you think will happen?

Dr. ABKOWITZ. I think telecommuting is an interesting idea, and I think it is one that obviously whose time has come if we choose to implement it on a broad base. The technology is there. Those people who have been involved in telecommuting as a technology and have implemented it in places have found that it is very beneficial for certain things. When you have business meetings or things of that nature or meetings that are not absolutely necessary, but useful, it serves that purpose. But it has really fallen well below what most people's expectations are and I think that is because there is just no substitute for face-to-face interaction, as well as—the expression I have heard for people in the personal needs side—there is just no substitute when you go to the grocery store of squeezing the apple or feeling the grapefruit. You just do not want to order those things by telecommuting.

Mr. CLEMENT. Thank you very much, Dr. Abkowitz.

Dr. ABKOWITZ. Thank you.

Mr. CLEMENT. Next, we will hear from three witnesses on highway issues. On the agenda is Mr. Ron Gant, President of the Tennessee Trucking Association; Mr. Brad Miller, Executive Vice President of the Tennessee Road Builders Association; and Mr. Wesley Ball, President and CEO of the Tennessee Grocers' Association and a member of the Tennessee Highway Users Association.

We will start with Mr. Ron Gant.

TESTIMONY OF RON E. GANT, PRESIDENT, TENNESSEE TRUCKING ASSOCIATION; BRADFORD MILLER, EXECUTIVE VICE PRESIDENT, TENNESSEE ROAD BUILDERS ASSOCIATION; WESLEY A. BALL, SPOKESPERSON, TENNESSEE HIGHWAY USERS CONFERENCE

Mr. GANT. Chairman Anderson, Congressman Clement. The Tennessee Trucking Association appreciates this opportunity to appear before you this afternoon. The subject of today's hearing, the nation's—and more explicitly, Tennessee's—infrastructure needs is one of the more paramount issues in the trucking industry, but even more fundamentally to our nation, its people and our way of life.

The economic health of Tennessee is vitally linked to trucking. A quick view of some of the facts concerning the industry in Tennessee will underline trucking's prominent role in Tennessee's economy. According to the 1988 data, the industry employed more than 150,000 people in Tennessee. Had a payroll in excess of $2.8 billion. Served all of Tennessee's populated communities, 75 percent of which had no other commercial transportation. Had a growth of some 15,000 jobs from 1985 to 1987. Paid over $500 million in state and federal highway user taxes—nearly $10 million a week. And while heavy trucks constitute only 1.4 percent of all the vehicles registered in our state, they paid 38.9 percent of all highway user taxes. Heavy trucks paid 45 times the state and federal taxes paid by the average car in our state. And trucks hauled over 70 percent of the manufactured goods into and out of Tennessee.

Our nation, and more specifically, Tennessee has been well served by the Federal Aid Highway Program which has provided for the development of our national highway system. Keeping in mind Tennessee's location within one day's drive of 70 percent of the nation's population, we have become a distribution center that has greatly benefited from the interstate and federal highway system. In addition, Tennessee has undertaken an aggressive road program to ensure access to and from the interstate system for all Tennesseans. This has been addressed earlier today.

Yet, with all of the system development undertaken, we do not today have the plan in place to meet our highway infrastructure needs into the 21st century. The new federal highway program to be addressed in 1991 by the Congress must use as its foundation the national system of interstate and defense highways and major primary highways of significance. This system must be complemented with arterial routes for access.

This new system of highways, referred as the Highways of National Significance, must be upgraded in design and construction to carry the increased volume of traffic, including a major portion of the commercial traffic in Tennessee and our nation. In addition, there must be continuing federal support for those routes not on the national system, as these routes often are the originating and terminating routes for many shipments which will use the national system ultimately.

Of major concern to Tennessee trucking firms has been the policy of building balances in the highway trust fund for federal budget deficit reduction purposes. This policy has ensured that we have neglected necessary new road projects and have failed to maximize our maintenance of the existing system. We must not continue a policy of collecting a user fee for a specific purpose and then fail to expend it for the purpose for which it is collected when there is demonstrated need. It is the position of the Tennessee Trucking Association that the trust fund should be spent down. That the 2.5-cent deficit reduction fuel/gasoline tax be returned to the trust fund in 1995. Only then will the concept of a user fee be restored. And while we are at it, under the user fee concept, why not abolish the current exemptions for gasohol. Users are users, regardless of the type of fuel. And all gasohol users should financially support our highway system's development and maintenance at the same level as fossil fuel users currently do.

Also at focus here is the increasing pressure to divert user fee and trust fund dollars for non-highway purposes. This, once again, attacks the fabric of the user fee concept and is one to which we as an association and industry are opposed. We must first see the financing mechanism that has built our road system not become used for other purposes, regardless of worthiness, prior to increasing taxes.

And where does the Tennessee Trucking Association stand on the issue of increased fuel taxes next year with highway reauthorization? Until the current trust fund balance is drawn down and the aforementioned 2.5 cents is returned to the trust fund, the membership remains steadfastly opposed to any fuel/gasoline tax increase.

The Tennessee Trucking Association is concerned about the most cost-effective application of highway tax dollars. In this vein, we would suggest that increased attention can be given to the studies which indicate a disproportionate increase in the life expectancy of highways with thicker pavements. The American Association of State and Highway Transportation Officials reports that one additional inch of concrete pavement doubles the strength of the pavement and the life expectancy as well. Yet, the cost of that one inch adds only four percent to the construction cost and less than one percent to the total project costs of a rural interstate highway.

Carrying pavement thicknesses to 14 inches from the traditional ten will yield eight times the durability, while adding only two percent or less to the total construction costs. Why not use this technology to increase the long-term value of the highway user tax dollar which we in the industry like to view as a capital investment not unlike many others which we make.

The subject of increased truck productivity is one that is receiving intensified attention as the highway reauthorization deadline approaches. The Tennessee Trucking Association believes that there are two productivity elements which merit serious consideration. Both are part of the report to Congress earlier this year by the Transportation Research Board. Those items are the allowance of states to permit weights above the current 80,000 pound threshold with permit fees commensurate with the additional associated costs; and a liberalization of the federal bridge formula to benefit trucks with shorter wheel bases.

A secondary development from these two recommendations would be the probable addition of axles on the traditional five-axle tractor/semi-trailer combination vehicle, which would result in increased productivity without changing current axle limits. The positive impact upon costs and the environment would be substantial.

There is one other topic of major importance that we must not—that must not be ignored as we plan for the future. The safety on our nation's highways, especially in commercial vehicles, has increases substantially in the past ten years. Fatality rates have declined significantly. The federal/state commercial safety enforcement program, known as the Motor Carrier Safety Assistance Program, is a major factor and must receive additional funding for inspectors and training. In addition, increased commitment to research on safety design factors and driver performance will pay dividends not only to the trucking industry, but also to the general motoring public as well.

In conclusion, the Tennessee Trucking Association believes that deliberate consideration of all of the objective factors on the issue must be the foundation of the Highway Reauthorization Act of 1991. A strong national highway system funded primarily on the federal level without shifting responsibility to state and local governments is in the best interest of transportation in this state and nation. When one takes the broader view that our economy is certainly transportation dependent and international in scope, the dynamics increase, but so should the commitment for practical solutions. We commend the House Committee on Public Works and Transportation for coming to Nashville and seeking Tennessee's view on this very important topic for the Congress of 1991.

Mr. CLEMENT. Thank you, Mr. Gant.

Next would be Mr. Brad Miller, Executive Vice President, Tennessee Road Builders Association.

[The prepared statement of Mr. Gant appears on p. 2321.]

Mr. MILLER. Mr. Chairman, Congressman Clement. I am pleased to present testimony today before the House Committee on Public Works and Transportation on the status of this country's infrastructure and particularly its transportation system.

I am here on behalf of the members of the Tennessee Road Builders Association and its national affiliate, the American Road and Transportation Builders Association, to lay before the committee the problems with our transportation infrastructure and what it will mean if, as a nation, we fail to correct the deterioration in our highways and bridges and streets.

We know a problem exists. The Federal Highway Administration in its 1989 Conditions and Performance Report to Congress stated that a federal highway program of $40 billion per year was necessary to correct the deterioration of our highways. In its survey of priority issues, the National Conference of State Legislatures ranks roads and highway construction and improvement as the third issue behind tourism and agricultural environment, neither of which can prosper and grow without a sound transportation system.

At the outset, I will say that we believe that the financial decisions that the U.S. Congress makes next year in the transportation area will have a direct impact on the nation's economy and well-being long into the future. But first, we must ensure that the federal highway users' fees are not raised for non-transportation purposes, including to help balance the federal budget. The highway trust fund, along with the federal gasoline and diesel excise tax, was established to solely fund the construction and repair of our highway and bridge system. Diverting these funds would severely impact the ability of federal and state governments to meet identified infrastructure needs.

America is built on mobility. Its vast size places a high value on the ability to move people and goods over both short and long distances in an economical and efficient manner. The American highway system, developed jointly by the federal and state governments, has had more to do with our quality of life and economic prosperity than any other single factor.

The efficiency of our highway system also has a direct effect on productivity. It is a documented fact that countries that sustain a high level of public investment relative to output experience highway productivity growth.

During the past two decades, Japan has invested about five percent of its output in public works and achieved an annual productivity growth of over three percent. The West German experience is similar.

The United States, meanwhile, has maintained a low public investment ratio of three-tenths of a percent and an inferior productivity growth just six-tenths of a percent per year. The fact is, the United States ranks 55th—I think as the Chairman brought forth awhile ago—in the world in public capital investment. To me, this is a national embarrassment. It is also a sure prescription for economic decline.

Everywhere you look, nations that want to be a major player in the global marketplace have been investing heavily in surface transportation improvements: Germany, Japan, Hong Kong, Korea, China, Spain and so forth.

Today, America's federal highway system—the backbone of our national economy—is in serious trouble. While this network of highways and bridges comprises only 22 percent of the nation's total road mileage, it carries 81 percent of all the travel and more than 1.6 trillion miles per year.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the federal aid system are either structurally deficient or functionally obsolete. The same report states that more than 40 percent of the pavements on the federal aid system are in poor or fair condition.

In 1989—this 1989 report and the Federal Highway Administration's 1988 publication, "America's Challenge for Highway Transportation in the 21st Century," both state that meeting existing capital needs on the federal aid system alone requires a $40 billion per year investment in transportation construction projects—a rate of spending substantially in excess of the current obligation for the Federal Aid Highway Program.

Meeting these qualified needs on the federal aid system is one of the major financial challenges facing the nation. Failure to provide an adequate and usable highway system will have a profound effect on the quality of American life, our economic growth and development, and our ability to meet the national defense requirements.

The Federal Aid Highway Program has been a driving force behind building a better America. The reauthorization of this federal program should foster continued opportunities for growth and development.

If the program's reauthorization legislation does not address known needs in a meaningful way, the deterioration of our Federal Aid Highway System, which is becoming more apparent every day, will continue, placing the American economy in danger. Today, highway disrepair and congestion are contributing to increased economic costs, air pollution and wasted energy resources.

Americans continue to commute by private automobile. Such travel is up 17 percent since 1960 and contributes to significant rush hour congestion on 65 percent of urban interstate system mileage. The outlook for the future is not good. Traffic is projected to grow by two to four percent per year in the next decade ahead.

According to federal statistics, the nation now wastes 1.25 billion hours and 1.38 billion gallons of motor fuel due to congestion on limited access highways each year. By the year 2005, that waste could soar to 6.9 billion hours in lost productivity and 7.32 billion gallons of squandered fuel.

Economists at the U.S. Department of Transportation estimate that if our highways are allowed to continue to deteriorate, by 1995, the U.S. economy could potentially miss out on increases of 3.2 percent of gross national product, 5.9 percent of disposable income, 2.2 percent of employment and 2.7 percent in manufacturing productivity.

Disinvestment causes much of our current problem. Total public capital expenditures for highways and bridges has dropped from 1.4 percent of gross national product in the early 1960s to about 0.5 percent today. During this same period, traffic on the Federal Aid Highway System has increased five-fold.

Inflation has also been a hidden factor. Between 1959 and 1988, the U.S. inflation rate, measured by the Consumer Price Index, rose slightly over 300 percent. The highway user fees supporting the highway trust fund and paying for highway improvements increased by only 100 percent.

Assuming a moderate future inflation rate of four percent per year, the federal gasoline user fee would have to increase to 26 cents per gallon by the year 2000 just to maintain its 1959 purchasing power.

What should be done? The solution to our highway problem is obvious. We must begin investing in the future. Providing adequate resources is the key.

One alternate is to spend the current cash balance in the highway account of the highway trust fund to address the call for greater highway improvement expenditures. But how far will that $10 billion balance go?

An examination of the language of the Highway Revenue Act authorizing the highway trust fund shows that deficit spending in this fund is prohibited. Since the entire balance cannot be spent, the portion that is available—between $5 to $8 billion—will not significantly increase the current program.

Apogee Research, a leading public works consulting firm based in Washington, has developed a computer model for ARTBA which allows a review of possible program funding scenarios and their effect of the trust fund balance and program spent out.

The American Road and Transportation Builders Association believes a federal reauthorization package providing $40 billion per year for highway and bridge improvements is what is needed. Such a program level is totally consistent with the needs identified by the U.S. Department of Transportation referred to earlier in our testimony.

To authorize and carry out a program of this magnitude would require ensuring that all federal highway user fee revenue contributed to the highway trust fund, plus interest earned on that money, is spent in a timely manner. A draw-down in the trust fund's current $10 billion plus cash balance is part of this plan. Removing the Federal Aid Highway Program from the Unified Federal Budget in order to ensure that revenues are not impounded or withheld in the future. Increasing the federal highway user fees to raise the additional $25 billion per year that is necessary for a $40 billion per year federal program of highway improvement assistance. No longer imposing artificial obligation ceilings on the expenditure of federal highway funds. Repealing the current six cents per gallon federal tax exemption on gasohol sales for highway vehicle usage, which causes an estimated $500 million per year loss to the highway trust fund. And tightening the federal highway motor fuels collection procedures.

Such actions would assure that future generations have a highway system on which they can build. The historic role of the Federal Government in the development and upkeep of a national highway network should be maintained.

Relatively, David Alan Aschauer, a senior economist with the Federal Reserve Bank of Chicago, and Richard Mudge, the former head of the Congressional Budget Office's Public Investment Unit, quantified the long-term national economic impacts on ARTBA's proposed program. Their findings are dramatic.

By the year 2012, national productivity would be 7.7 percent higher, resulting in an additional $400 billion per year in gross national product. The expected productivity gain would generate an additional $29 billion per year in corporate profits and a $35 billion annual increase in private investment. This is an excellent return on your investment.

There is no question that the Federal Government has a clear role to play in the development and upkeep of a national system of highways and bridges. The federal responsibility is defined by the Constitutional mandates that regulate commerce among the states and other nation—and with other nations, provide for the national defense and safeguard the public health.

America is literally at a crossroads. We can continue to ignore our serious and growing highway and bridge problem. Or, we can choose to invest about $40 billion annually that is necessary to rebuild and expand our national highway network to meet current and future demand.

Good roads save lives, improve productivity and enhance competitiveness. In short, it is an investment in the future.

I would like also to mention that we support the recommendations of the Transportation Research Board Special Report 225, especially the one that recommends adoption of the TTI HS-20 Bridge B Formula. This TTI HS-20 Bridge Formula up to 80,000 pounds gross vehicle load considers HS bridges—HS vehicles only and does not have the H-15 restriction as in the present formula. This is proper since hardly any H-15 bridges exist on the interstate any more. From 80,000 pounds up, the present Formula B would be retained. This scenario is expected to produce shipper savings of $5.48 billion annually and have minimal cost impacts. There would be a net reduction in pavement costs of $10 million and an increase of $900 million in bridge costs per year. This presumes that all bridges with a load capacity of less than this formula will be replaced. In actuality, most will be posted or strengthened, which would reduce the annual cost significantly. This formula would provide considerable relief to short wheel base natural resource haulers.

I thank you for allowing me to testify before the Committee and at the proper time, would be glad to answer any questions.

Mr. CLEMENT. Thank you, Mr. Miller. And I would might say to all—because that was an excellent testimony—but, in order for everyone to be heard, the witnesses—we are going to incorporate all the testimony into the record as if read. And what we can do from now on—starting now—Mr. Ball, if you so desire, you can read your statement or for you or any of the others, we can incorporate your statement in the record as it is read. But I assure everyone, as you can tell, it will all be transcribed and be shared with the other members of the Public Works and Transportation Committee. That is correct, is it not, Chairman Anderson?

All right. The next witness is Mr. Wesley A. Ball, Spokesperson for the Tennessee Highway Users Conference.

[The prepared statement for Mr. Miller appears on p. 2442.]

Mr. BALL. Thank you, Mr. Chairman. Thank you, Congressman Clement. I am Wes Ball, President of the Tennessee Grocers Association and a member of the Highway Users Association. And I am here to present a prepared testimony for the Highway Users Conference.

The Highway Users Conference is a statewide non-profit organization consisting of various groups—hotel, motel, auto clubs, farm groups and other people interested in maintaining a excellent highway system, with particular interest to roadway drivers, as well as vehicles and energy.

We commend you for being here and appreciate and would like to welcome you, along with the 43 million other travelers who come here each year, depositing along the way four million dollars annually with us. There is a direct linkage in that eighty-one percent of those people came by the highway.

The Highway Users support the development and designation of the highway scenic byway systems. In 1982, our state designated 2,300 miles of Tennessee Parkway, and we feel that this system could be best used by integrating it with the national system so it can be designated, promoted and standardized. This would help the hundreds of small towns along these areas to benefit from tourism, as 17 percent of our highway mileage is for the purpose of tourism.

Our highways are important to carry our workers to our plants and our products to our locations.

Forty percent of our bridges are deficient in Tennessee. Three hundred highways are identified as needing major improvements in the next 15 years. We are looking at an expenditure in excess of $10 billion necessary by the year 2000.

The infrastructure needs of Tennessee is to assure funding sources. The user pay-as-you-go provides us with a highway system that is the envy of many. We need the user fee left in place without diversion measures as passed recently by the Congress where the motor fuel tax was used for budget.

We urge that the $17 billion balance in the highway trust funds be accelerated in dealing with problems that exist today.

Congestion, bad roads, poor traffic control and management increase traffic accidents and the cost of transportation. Our state experienced 1088 traffic fatalities in 1988—2.2 per 100 million motor miles, below the 2.3 nationwide average. But with the increase of four percent nationally in transportation, the death toll by the year 2000 could easily reach 80,000 people. We are committed to working with getting the rate nationally and in Tennessee down to 1.5 per 100 million miles.

We appreciate your being here and certainly urge that the 1982 Highway Program for—that must be passed by September 30, 1991 be passed quickly so that we might have an orderly development of our transportation system.

That ends the coalition. I would like to share one thing with you as a person who uses lots of transportation and pays lots of dollars. I investigate costs of operation, and as such, offer a little editorial. And in my November editorial, I would like to read as follows:

"Think about it. The average cost of a gallon of gas in 1973 was 39.3 cents. In November of 1990, it was $1.369. That is a 348 percent increase. With the additional five cent gas tax December 1, Tennessee will have a total gas tax of 35.5—that is 14.1 federal, 21.4 for Tennessee—up from eight cents—four federal, four state of Tennessee—in 1973. That is a 323 percent increase in the cost of fuel and a 444 percent increase in the cost of tax. With 375,000 troops in Saudi Arabia to staff Operation Desert Shield, is it possible we are watching the wrong people?" [Laughter.]

"The function of the cost of tax to a gallon of gas has gone from almost exactly 20 percent in 1973 to at today's price as I drove in, 37-plus percent today. Folks think we are whipping up on them."

I have that information for the Committee if they care for it. I appreciate your indulgence.

[The prepared statement of Mr. Ball appears on p. 2310.]

The **Chairman**. It will be in the record. And Mr. Gant, Mr. Miller and Mr. Ball, I would like to thank all three of you for your statements. I do have one question. And you are aware, I know, that our highway bill and the current highway policies expire this coming—just a few months ahead of this coming year. And so, we are holding hearings. We are meeting back there now trying to redraft the new bill to pass so that it will be in effect when the current one expires. Now, as we consider reauthorization of the surface transportation program, what issue do you feel is most important from your perspective? Does anyone want to—Mr. Miller, you have got your hand up.

Mr. **Miller**. I will be glad to. The issue we think is most important as you consider the 1991—and get ready for the 1991 highway bill is to consider the deterioration of both our highways and our bridges and hope that you can persuade the entire Congress the importance of funding a three trillion dollar infrastructure system across this nation and that you will in some way get enough funding in the act to try to fund $25 billion in additional funds for the highway system each year out of the trust fund. Short of that, we hope that you will look to the future and possibly get as much funding as you think the good Congressmen in Washington can stand and still go home, in order to keep our infrastructure up.

I have been responsible, I guess, for helping to pass four different gas taxes in this state since 1982. Each time, those that were supportive of our tax and the program have received accolades from their constituents back home.

I will relate a very short story. I know we are pressed for time. But there was one particular legislator here that did not support the program. He went home that night and got several calls thanking him for passing a gas tax so that they could repair the roads. I said, "Well, Mr. Representative, what did you tell those people?" knowing that he voted against it. I was able to count votes pretty good. And he said, "I told them the legislature in all its wisdom was able to fund a good road program for the state and we were happy that they were glad to have such a system." So, I hope that in the act that you can make some arrangements for increased funding for our highway program.

The CHAIRMAN. Mr. Clement.

Mr. CLEMENT. I will try to keep this brief, but I know the comment was made awhile ago about the trust fund. It should be drawn down and maybe eliminated and the revenue funneled to the states through revolving loan funds or block grants, is that my understanding, Ron Gant?

Mr. GANT. That was not—that portion of it was not expressly in our presentation, Congressman. I think without question, we are——

Mr. CLEMENT. I understand that, but I mean if it is drawn down——

Mr. GANT. Absolutely.

Mr. CLEMENT [continuing]. What do you expect thereafter?

Mr. GANT. I think in that situation—you know, we in Tennessee, as you well know, are a conservative state and we have had a pay-as-you-go type program in this state in road construction over the years. Actually, I think greatly enhanced by your father some years ago. Realistically, what I think we have got to do is—and Mr. Miller alluded to it to some degree—I do not think you will find that this industry is going to object to increased funding and increased taxes as long as there is that direct return because, in fact, productivity is going to be increased not only for us in this industry, but nationwide. But, the commitment has got to be that we are going to return to a user fee concept and not utilize the highway tax dollar as a mechanism for other undertakings within the Federal Government.

Mr. BALL. It appears at the moment that there is a sufficient amount of revenue being generated to carry the system forward for the next six to seven years. I do not think a rate adjustment is what is needed. I think an acceleration of the expenditure of that which is coming in and not using it to offset budget deficits, but to use it for what it was, in fact, clearly collected for and intended to be used for——

Mr. CLEMENT. So, these billions of dollars being collected, it should be drawn down more expeditiously at a more rapid rate.

Mr. **Ball**. That would help.

Mr. **Clement**. Let me ask you, too, also about the triple trailers. I know in Tennessee, we have the double bottom trailers. Now, people are talking about the triple trailers. Maybe they got the quadruple in the state of California where Chairman Anderson is. I am not sure, but what about the triple trailers? What is the future for that, and do you support it?

Mr. **Gant**. I think there are probably two issues there. First of all, I do not envision any time in the near future that the industry in Tennessee would necessarily undertake approval of triples in Tennessee. I think at the same time, we have to be realistic that Tennessee is not an island. And by virtue of that, we have got to be aware of what is transpiring in adjacent states. Triples are only one state away in Tennessee, Arkansas being the buffer state at this point in time. We need to be able to be responsive in Tennessee. The safety record for triples operation nationwide, especially out west, is incredible. We do not think that safety is a factor. I think that one of the key things that I would see there is that it is important that Congress not mandate to the states the authorization of triples. But it is also important that Congress not prohibit states from making that decision. Those states that currently do not authorize triples for operation in the future.

Mr. **Clement**. Well, thank this panel. Thank you very much.

Mr. **Miller**. Let me point out one thing, Senator. I just cannot pass this up.

Mr. **Clement**. Oh, he has promoted me to Senator.

Mr. **Miller**. The average driver a year—just one second. The average driver in this country will use approximately 500 gallons a year. That will carry him about 10,000 miles. Then, you can multiply it up if he wants to go 20,000. At a 35 cent tax on that 500 gallons, you are talking about $175 that the average driver is paying for a year to maintain good highways in the state of—in this country.

The **Chairman**. Just a comment, I think you all—all three of you are probably aware that in California where I come from, we do support the fact that the—it should be the Federal Government that should be doing this whole highway, bridge—the whole infrastructure problem. But in addition to that—and if I remember right, the Trucking Association, the Road Builders and the Highway Users are all part of this—they did decide out there that in addition to what the Federal Government did, we should have some money out there to maybe help stimulate—or whatever it would be—I know they passed and put this to a vote of the people and it was carried overwhelmingly—they added an additional nine cents tax just to keep—what the Federal Government does to even make it move along and I guess to match it—get where we have to match federal funds. And I think all of you people are also part of that, at least your local state branch of this particular association you represent.

Mr. **Miller**. Yes, sir. We are using the first part of our gas tax, up to the last two that we passed, were for matching funds, along with most federal programs. And then, trying to take care of primaries and secondaries. The last two taxes that we passed here went 100 percent for state highway systems. Not any of that money went on federal highways. And we are trying to carry our load, and we need some help from the Federal Government to maintain federal highways.

Mr. **Clement**. Thank you all.

The **Chairman**. Thank you.

Mr. **Clement**. Next on the agenda is Mr. Dan Lane, Chairman of the Board of the Metro Transit Authority. Dan Lane is the owner and principal broker of ABL Realty Services and currently serves as the Chairman of the Board of the Metro Transit Authority. Dan will testify on urban mass transit issues. It is a pleasure to have you here, Mr. Lane.

TESTIMONY OF DAN LANE, CHAIRMAN OF THE BOARD, METRO TRANSIT AUTHORITY

Mr. **Lane**. Thank you. Chairman Anderson, Representative Clement. Thank you for the opportunity to define what I see as the prospects of transit in the federal reauthorization of surface transportation.

Before I get into the report, I have decided I would not read it. A good friend of mine, Councilman Fincher said, "If you read all that, I am going to cut your budget." So, I am going to take his suggestion and not read it. But I would like to summarize what I think are some key features of the presentation.

Our surface transportation, I think, has been sort of defined over the past 30 years when we look at the interstate system that we have here. Likewise, I think in middle Tennessee, we have seen our economy, our population and our growth more than double. And it is predicted, based on recent studies—one in particular that we are having done—that employment, the economy and the population will probably double again in the next 20 to 30 years.

Now, our position is no matter how much investment we put in building roads, we cannot keep up and get the dollar value from building roads that we have gotten in the past. So, we have to look at other means. And we offer a different approach. And we say transportation should be looked at in terms of mobility, which requires a comprehensive approach, which depends more on just pouring concrete or building railways.

We think it should include more freeways—yes, we do need more roadways. We need transit ways also. We need more rail lines. We need more high capacity vehicles on the road. We need smarter roadways. And we also need to look in terms of how we design our cities and place more emphasis on design for pedestrian movement. And also on our urban design and planning system to be able to bring people and functions together.

Just—I want to quote one thing. Andrew Kimbrell of the Foundation of Economic Trends states,

> In the United States alone, we could save 33 million gallons of gasoline every day and significantly reduce air pollution if the average commuter passenger load were increased by one person.

Very simply. If we can get one person to stop driving and ride with someone else, you can look at the benefit. So, we have to look at new direction and look at the problem from a total perspective and learn from the past and plan better for the future.

San Francisco. And oftentimes, people—public transit providers, many times, I think find themselves on the defense having to defend the subsidies. And the typical consumer tends to think that the gas tax is used to build roads and that we do not publicly subsidize the highway system. But, I think we do. We build more freeways. We cause more congestion. We raise the tax to build more freeways. So, we are investing public funds and subsidizing our highway system.

Now, in San Francisco, in looking at the whole issue—and we have to consider the issue of our quality of life, the environment that we live in, the air quality that we breathe—it was proposed by some private sector leaders that we look at some type of pollution tax. Now, if we inject some market flexibility into the issue, some people probably will opt for that type of a tax. Others will probably say, "I will not drive. I will stop driving and do ride sharing." Others will probably say, "Well, what can we do to increase the technological advancement in pollution control?" But I think we have to look at some of the negative aspects of pollution, particularly pollution from the automobile, and try to devise some ways that we can tax that. And we are recommending that you look at a tax on pollution from a national level.

The other thing, I think, is often during the time of an energy crisis, I think this nation begins to look at basic transportation facts. We are recommending—and also in the past two crises that we have gone through—once the crisis is over, there seems to be less of a political compulsion to do rational planning for our energy and transportation in this country. And we are recommending that we do it on a more rational, long-term approach. We need to look at and influence designing our cities so that we concentrate more on moving people, rather than moving vehicles.

If you compare certain cities, you know, like Los Angeles and Houston, which are considered modern cities that was built around the automobile, with cities like even New York, Boston, Chicago, you can see a significant difference in terms of the consumption per capita and the amount of pollution per capita. If we look at some of the old world country cities, Vienna, Zurich, Berlin, which was large concentration built before the availability of the automobile, we see even less consumption and pollution per capita. So, we have to look at, as we rebuild our infrastructure, to look at planning and look at the impact on people. And we have to look at a balanced approach in terms of how we move people and look at it as a problem of mobility, rather than building more freeways.

With that, I will end. Thank you, and we are happy to have you here in Nashville.

[The prepared statement of Mr. Lane appears on p. 2329.]

The **CHAIRMAN**. Mr. Lane, thank you for your statement. Now, we all know that with the new realities of energy and economy and transportation, that greater than ever demands have also been placed on our Nation's public transit system. Now, if you had to single out the major issue facing the future of transit in the United States, what would that be and what role should the Federal Government play?

Mr. **LANE**. I think the most critical issue facing transit is one of perception. We like to think that the users should totally pay the bill for public transit. I think that at the federal level, we need to make public transit and infrastructure and fund it, and I think we will see the results—the beneficial results.

The CHAIRMAN. Mr. Clement.

Mr. CLEMENT. What about land planning to get people to use mass transit?

Mr. LANE. Well, I think——

Mr. CLEMENT. Is that a feasible option?

Mr. LANE. Yeah. I think from a local and state planning process, and even from a regional process, we have to bring all the elements together as the doctor from Vanderbilt was indicating to be able to maximize mobility—both goods and people—that we have to look at land use planning as it relates to our transit system. No question about it. And we have to evaluate any development in terms of impact of the transportation system that we currently have and that we would like to have. Because all of it—I think, if we are not serious, a few years from now, we will learn about more negative impact in terms of our quality of life in terms of pollution and air quality that we breathe. So, we have to bring it all together.

Mr. CLEMENT. Well, I tell you what. This issue of mass transit, you and me and many others here in the Nashville and Greater Nashville area sure need to spend a lot of time on it and bring the contiguous counties into it as well and have a coordinated effort because this is, in my opinion, critically important for all of us in the future. And, you know, a lot of people do not see the purpose for mass transit or they want someone else to use it, and they do not want to use it themselves. But we have sure got to be more creative and innovative in the future than we have been in the past when it relates to mass transit and give it some dignity.

Thank you very much, Mr. Lane. We appreciate it.

The next group that I would like to come forward, I know you thought it would never get to be your time, Mr. Mathews. Robert Mathews, Chairman of Metropolitan Nashville Airport Authority. I would like also General Moore, President of the Metropolitan Nashville Airport Authority. As well as Mr. Les Sutton, President of Ingram Barge Company.

Chairman Mathews.

TESTIMONY OF ROBERT C.H. MATHEWS, JR., CHAIRMAN, METROPOLITAN NASHVILLE AIRPORT AUTHORITY; GENERAL WILLIAM G. MOORE, PRESIDENT, METROPOLITAN NASHVILLE AIRPORT AUTHORITY; LES SUTTON, PRESIDENT, INGRAM BARGE CO.

Mr. MATHEWS. Congressman, I am going to take a cue from my Councilman, Charlie, and not read my remarks. I know they are in the record. But I would like to digress just a little bit. And I am certainly sorry that Congressman Valentine is not here.

Mr. CLEMENT. Well, introduce your Councilman back there. I want you to. If you do not, I will. We are pleased to have him.

Mr. MATHEWS. Charlie Fincher, why do not you stand up?

Mr. CLEMENT. Charlie is a great friend, a great Councilman, does an outstanding job for Nashville.

Mr. Mathews. I am sorry that Congressman Valentine is not here, but I would like to state, Mr. Chairman, just a start fact. First, Nashville, North Carolina is older than Nashville, Tennessee. That is the first thing.

Mr. Clement. We learned that at lunch.

Mr. Mathews. I heard you did. The second one was that I am extremely fond of you, Congressman Clement, and I compliment you on your historic and geneologic connections with Andrew Jackson. But I thought it would be fair also to put it in the record for Congressman Valentine that Andrew Jackson, matter of fact, was born in North Carolina.

Mr. Clement. That is correct. But he did not point that out.

Mr. Mathews. The other one I would like to ask Chairman Anderson is I want to know—it is more of an economic statement for us. A question from our state, and it is, Congressman Valentine and Congressman Clement agree, which state has the best country ham and if they would tell you about it, then we would most helpful to know if it is from North Carolina or from the state of Tennessee. And if you could let me know that sometime, I would appreciate it.

Mr. Clement. Country ham, which state, North Carolina or Tennessee.

The Chairman. You better answer that one. I cannot.

Mr. Mathews. I will leave that up to you. But, I would like——

The Chairman. I will ask him and get the answer.

Mr. Mathews. Thank you, sir. Well, it has been a debate for a long time around here.

Mr. Clement. Are we talking about hams or country ham?

Mr. Mathews. I said country ham. I will let you play the words if you want to.

I would like, though, to emphasize my written remarks by giving—paraphrasing of my closing remarks.

Mr. Clement. All right, Chairman Mathews, your comments will be incorporated into the record as if read.

Mr. Mathews. We recognize the important mission of this Committee in Congress, and I would be remiss if I did not emphasize that attention to all the modes of transportation. And I underline the word "all." It is vital to our region, as you all are well aware, and it is a great concern of this community that well-documented problems with roads, rivers, bridges, airports, seaports and sewer systems have been found by your Committee. We urge that the concepts and the funding necessary to achieve the superior status in all modes of transportation should become a national priority. In addition to the basic needs for improved and new infrastructure, let me suggest that regions like Nashville would benefit from futuristic thinking that incorporates mass transit, such as fixed rail access to and from communities surrounding its urban core.

Congressman Clement, you are to be congratulated. You have helped us be innovative in many ways in our air transportation system, and we believe that Nashville and cities of this size can be a model for other kinds of innovative thinking. It is also my belief that a nation should allocate additional federal funds for legitimate research in the critical area of transportation by our nation's universities and colleges. I think that the doctor from Vanderbilt was very creative in some of the thoughts that he had about management. It is now apparent that Nashville and its sister cities throughout the nation, as I said just a minute ago, have unique opportunities to participate more fully in the full range of opportunities available through expanded domestic and international business and cultural activities. The extent of these opportunities is directly related to our government's commitment to air, ground and water transportation. water transportation.

In closing, let me thank you again for coming to Nashville to hold these important hearings. And I would like to also—as you have already done, allow us to answer any questions that you might have of General Moore, who is President of the Airport Authority here about our particular interest, which is air transportation. And we would not be shy enough to say that we would not be interested in talking about any kind of transportation that supports our region.

We thank you for letting us be here, and I just turn it over to either Mr. Sutton or to General Moore or back to you, sir.

Mr. CLEMENT. General Moore, did you have a comment?

[The prepared statement of Mr. Mathews appears on p. 2342.]

General MOORE. I think the main comment that I might make is—this sort of responds to the question that the Chairman has been asking—what is the major issue that should be addressed? What is the priority?

In air transportation, I do not think there is any question but that the priority is capacity of our system. It is growing very rapidly. It is outgrowing the infrastructure of the airport system around the country, and that infrastructure is going to have to be improved quite rapidly over the next few years if it is to continue to do the job that people want it to do.

Secondly, the availability of international markets to communities like Nashville—there are many of them around the country—who need international connections better than we have today. At Nashville, we can demonstrate that we could support, for example, 12 flights a week to London. London is—has a large group of country music enthusiasts who tell us that they want to come to Nashville, but they want to come direct. They do not want to go through Chicago or Atlanta or Cincinnati or Dallas. They want to come direct.

We have people—some three million people in middle Tennessee, southern Kentucky and northern Alabama who are constituents of Nashville International Airport who also want to fly direct to Europe. We are working that problem very hard, but we are frustrated by the bilaterals and the attitudes which seem to focus decisions not enough on community needs and the economies of the communities around the country, but more on the competition between airlines and the competition for travel dollars between nations. We think the communities should have a larger voice, and we urge that Congress urge the Secretary of Transportation to continue the move that he has already begun in that direction. That is very important to us and others.

Mr. CLEMENT. Thank you very much.

Mr. Les Sutton, President of Ingram Barge Company.

Mr. SUTTON. Thank you. I recognize the lateness of the hour, and so I, too, will just touch on the highlights of my written statement which does include some details and talks about international competition.

But I would like to concentrate on two points this afternoon. One, if strategic infrastructure is provided by governments, private industry and job creation will quickly follow. And two, infrastructure decisions are long term, and the benefits of the right decisions and the damages of the wrong decisions often do not show up until years after the decision is made.

And the barge industry, which I represent, is small enough and closely enough tied to its infrastructure that the effects of those links may be more obvious than in some other industries. The commodities we transport are so basic that when we suffer, we know that hardship is spreading throughout many other industries, affecting thousands of jobs.

Our primary products are coal to generate electricity and make steel; ores for the manufacture of steel and other metals; petro chemicals for plastic, cloth, cosmetics, et cetera; grain for export; asphalt, stone, sand for roads and other construction projects. So, when our industry has problems, it is very clear that many others are feeling the effects of lost markets.

You mentioned the infrastructure investment sponsored by President Roosevelt earlier, and that is one example that I wanted to use of a market developed by private companies taking advantage of the government infrastructure provided, in this case, by President Roosevelt—the locks and dams on the upper Mississippi River.

In the late 1960s and early 1970s, the world's most efficient producing, marketing and transportation system for grain was developed based primarily on that series of locks and dams that had been built just before the war and right after the end of the war on the upper Mississippi and Illinois Rivers. And that system was so efficient that by the early 1970s, it had captured 75 percent of the world's soybean market. And I think any of you will agree that 75 percent of any market is a real asset and it should be protected at all cost. Well, we did not protect it. We lost it partially by political blundering and, too, the failure or the threat of failure to maintain our infrastructure.

By the way, that downfall was started not by President Carter, but Richard Nixon was the first one to embargo grain. Many of you forget that. Of course, you guys probably do not. But that is correct, it was Nixon's first soybean embargo that started us down the road to losing that market because existing contracts with Japanese exporters were canceled. And at the same time, we got embroiled in a silly environmental fight by not sitting down and talking as we do today over replacing lock and dam 26 in St. Louis. So, that allowed the Japanese to say America is not a responsible supplier. So, they went down to South America, installed infrastructure to produce and transport soybeans because they could say America is not a reliable supplier. Make your deals with Argentina. Now, we have about 40 percent of the soybean market and very capable competitor for the foreseeable future. By the way, unlike corn and wheat, the government does not support soybeans. Of course, what do you think the farmers do with those acres that they cannot grow the soybeans on any more? They grow wheat and corn, and we have to support that.

So, we built and captured a market based on infrastructure. And then, by having no idea what we were doing, we lost that market by focusing on something else.

I would like to go back because I do want to tie in also something Dr. Abkowitz said and focus on gaining the market. Again, the Federal Government provided infrastructure. Private citizens captured the market.

And one of my sister companies—as I know the Congressman knows—is Ingram Distribution Company. And that company is the largest wholesaler of books in the United States. And it started ten years ago with a very small textbook distributor in Tennessee. Well, it took advantage of these crossing interstates in Nashville to pretty well guarantee you if you ordered a book anywhere in the U.S. from Ingram Distribution, you would get it within 48 hours. Again, a private citizen taking advantage of the infrastructure.

And I think Dr. Abkowitz's concept is, "Let us not leave that to chance." We may have a perceptive private citizen here and the upper midwest may have one there. But, let us take all our assets—our infrastructure—put it all together and in a coordinated way, see where we have the advantage. Where can we guarantee investment and head in that direction. And I am excited about his concept, and that is why I think sitting here with the airline representatives is very symbolic because we put all our infrastructure together, look at what we do best and then concentrate on that and assure these businessmen that that infrastructure was going to be maintained. Back to the failure to maintain it, it would have been very much cheaper for us to have supported that infrastructure than to have the consequences of the lost market. Our industry paid a devastating price. And while exact statistics are not available, about half the businesses that were—existed in the barge industry in the 1970s, do not exist today.

And incidentally, one of the first companies to go was S&H Transportation, which had its roots here in Nashville. So, many Nashvillians suffered severe economic consequences, which was a signal for what was to come throughout our industry. We did not only lose fringe or weak companies—stalwarts of our industry went down.

So, decisions made a long time ago that really did not show up until 1982—decisions made in the early 1970s did not start affecting us until 1982. So, all of the money that was invested in the barge industry between the mid 1970s and 1982 was cut in half by 1985. Again, long-term decisions. And I recognize that you face hard choices—not only how to allocate scarce resources between consumer expenditures and long-term investment infrastructure, but also, which types of infrastructure should be replaced first. And our industry has made some progress on how to invest—how to allocate investment along the inland waterways.

A few years ago, the Inland Waterway Users Board, made up of shippers and operators, was formed to advise Congress on within the waterways, where do we concentrate on spending on that infrastructure? And it has been very effective. And as long as it can stay independent, I think it will more wisely allocate waterway resources.

And I—again, I recognize how hard it is to make those decisions. I watch, with many of the rest of you, the debate on which taxes to raise and what to allocate it, and I appreciate your concern there. But it seems like a lot of those decisions were made this way every day, which taxes to raise and where to put the money. But I commend you for this process of listening to the users and I encourage you to take this information back to Washington and make those hard choices to sell your colleagues and use us to help sell them to sticking with those choices because failure to meet a consumer need affects the economy one time. Failure to meet an infrastructure need affects the economy again and again and again as the failure to maintain roads affects the cost of automobiles. It affects the cost of all the business. It affects the cost of getting the commodities to the river to load in our barges. It affects the electronics industry. And it also is not obvious until it is almost too late.

Let me make a comment on a couple of other items that were brought up today. The first, mass transit. And I probably should address this statement backwards. For those of you who—I lived in Houston, Texas until about 25 years ago, and I was back there Wednesday making a presentation out in the western suburbs of Houston. And think about Houston 25 years ago and Nashville today. And for those of you who think you can solve Nashville's problem by building more highways, you should have been in that cab with me on that 12-lane freeway going nowhere. We were inching along and six lanes on the other side was inching along. You cannot solve the problem by building more freeways.

Bicycle paths. And I am glad you did not bring Congressman Tauzin with you and I trust that he will not read this statement because I lived in New Orleans before I moved to Nashville. And there are not many things I miss about New Orleans. But one thing I do was that 17-mile long bicycle path along Lake Pontchatrain. It was a real asset to that city, and it is something that I really miss here as my family and my neighbors walk up and down the middle of the road dodging cars.

Thank you very much.

[The prepared statement of Mr. Sutton appears on p. 2451.]

Mr. CLEMENT. Thank you.

The CHAIRMAN. Well, General Moore, Mr. Mathews, Mr. Sutton, thank you for your presentation. I do have a question. Gentlemen, how important are general aviation and waterway facilities to the economic development in this area?

General MOORE. Mr. Chairman, I think it is important. The importance varies somewhat with the area that you might be considering at any one time. But you cannot have a big international airport in every county, for example, in Tennessee or Texas or California. But those counties are relying more and more on aviation than they have in the past because they have businesses. They have to conduct a business, in some cases, worldwide; in others, across the country. They use business jets or business turbo props to support that kind of activity, and they are important also from the standpoint of quality of living.

A little bit earlier, someone talked about the fun things up here at Springfield, and we do have a renowned aerobatic instructor out there at that airport. But what is wrong with fun in aviation in the air when it supports the quality of living of the people living in the community? We have a lot of aviation enthusiasts in this part of the world, around middle Tennessee. So, I think it is important from the standpoint of the people who look at it as a sport. It does create business. And from the standpoint of the necessary business that these communities have to conduct with other communities around the country.

Mr. SUTTON. I would like to also make a comment on that because Monday, I have three very important presentations I have to make: one at 9:00 in the morning in Pittsburgh, one at 1:00 in the afternoon in Philadelphia and 5:00 in Allentown, Pennsylvania. It would be very difficult to do that without a viable general aviation system.

And my written statement talks about the importance—in Nashville, the waterways are not as important to Nashville as they are to some of the others because of the way our waterway system is. But all of the asphalt, all of the cement, all of the sand comes to Nashville by barge. So, you are not going to find very much in Nashville if it wasn't supported by the inland waterway system.

The CHAIRMAN. Mr. Clement.

Mr. CLEMENT. Well, I am pleased that the comment was made awhile ago about international service because the only international service we have now is Nashville to Canada, is that correct?

General MOORE. Nashville to Toronto. And incidentally, Mr. Congressman, we have demonstrated that we could be supporting also 23 flights a week to Montreal. But that has to be worked out in agreement between the countries.

Mr. CLEMENT. I had breakfast not long ago with Mr. Crandall, who is the CEO of American Airlines. We talked a lot about international service for Nashville, Tennessee. I think we are all committed to that proposition because we are based in a region of the country that people want to come to. I know I had the opportunity earlier today to take Chairman Anderson around town. I took him to the state Capitol and I took him to Music Row and close to the Parthenon and by the airport to show him what Nashville, TN has to offer. And being on the Aviation Committee, I sure am interested in more international flights because it would be a tremendous economic boom for this area.

Mr. MATHEWS. Congressman, I must chime in to suggest that one of the parts of our aviation future has got to be the freight side of it. It all ties back to Mr. Sutton's thoughts. And we believe that is one of the underlying economic advantages to encourage international flight. So, we are working both the passenger side, as well as the freight side of it.

And I also comment along with Mr. Sutton, it would be fabulous to have a renaissance back to our river with bicycle paths not too unlike what they have in, say, even San Antonio. We have abandoned our river from its beauty, as well as its transportation. And I hope that somehow or another, the creativity, regardless where it comes from, ties those ideas all into one big package and we get our bicycle paths and our renaissance back to our river. We thank you for being with us.

Mr. CLEMENT. Nashville's future is just unlimited. The only way our future is limited is through no ideas. And as long as we are looking ahead and planning ahead, what was said awhile ago by Mr. Sutton talking about the infrastructure and the investments that can be made into the future, and even though we do not see it the next day, by making those investments, the dividends that take place from those investments—what about our port facilities, Mr. Sutton? What do we need to do? I know Chairman Anderson—my goodness, what he has done in California is remarkable.

Mr. SUTTON. I have——

Mr. CLEMENT. He will be remembered. As a matter of fact, he has got a lot of things named for him there in his area simply because he has been the difference.

Mr. SUTTON. I have been active in ports and waterways matters for a number of years. And port facilities need to be developed along with the other facilities, and there are people back in the audience that could answer this for Nashville better than I. But I do not think Nashville today is sufficient in port facilities. And as the commerce grows and as the businesses develop, usually, if governments makes way for port facilities, at least at this level, private industry is ready to do it. So, I do not see that that—my personal opinion is, that would not be one place that I would put the scarce resources. I think we could attract private investments in ports as long as we keep the waterways valuable and keep the traffic flow.

Mr. CLEMENT. Well, thank you all very much.

Mr. SUTTON. I would like to make one other comment because as I sat here and talked about international competition, I had forgotten because Ingram Industries does change our parent company. And our biggest brother now is not the book company that I talked about earlier, but it is Ingram Micro D, which is based in California, and which is very much involved in international competition. It is one of the larger wholesalers of computer hardware and software and very much cognizant of the costs that are—exist in the Pacific rim and we are now moving into Europe. So, we are operating that international distribution business out of Nashville, makes you very conscious of how important it is to stay competitive in infrastructure.

Mr. CLEMENT. Thank you all very much.

This is our final panel upcoming. I would like to ask Ms. Diane Davidson and Mr. Bob Saunders to take a seat. Diane Davidson is the Manager of the Brentwood Area Transportation Management Association and has worked extensively on transportation issues as they relate to bicycling. Bob Saunders is President of the Nashville Bicycle Club. Diane and Bob will discuss the role of bicycling in transportation regional planning.

Ms. Diane Davidson.

TESTIMONY OF DIANE DAVIDSON, MANAGER, BRENTWOOD AREA TRANSPORTATION MANAGEMENT ASSOCIATION; BOB SAUNDERS, PRESIDENT, NASHVILLE BICYCLE CLUB

Ms. DAVIDSON. Thank you. Chairman Anderson and Congressman Clement——

Mr. CLEMENT. What a great red letter day for all these nice comments about bicycling——

Ms. DAVIDSON. Oh, yes.

Mr. CLEMENT [continuing]. Without you even testifying.

Ms. DAVIDSON. I know. I could almost stop now. But I think often bicycles are relegated to the last and to an afterthought, so I am going to vote for the prerogative of making full testimony for that reason.

It is a pleasure to be here to comment on the shaping of the new national policy because just in ten months, Congress will be authorizing legislation that is really going to shape the destiny of the transportation process well into the next century.

I am here representing the Brentwood Area Transportation Management Association, which is a partnership formed in 1988 between the public and private sectors to provide leadership in the area of traffic mitigation. And BATMA has the distinction of being the first TMA to develop in the south, the 35th to develop in the nation. And now, there are over 120 TMAs in the country, many of which are in California. And BATMA has been a role model for the formation of many of the new ones.

Our primary goal has been to promote strategy and activities, including bicycling, that have provided congestion relief and we received national recognition for our innovation. In the belief that we must use all the tools at our command to solve the congestion crisis, and I think the other testimonies have gone over the reasons and the trends and how we are definitely facing a congestion crisis in both the suburbs and the urban areas. We have created park and ride opportunities with TDOT funding. We promote van pools. We have a computer matching system. We have mediated out problems between major developers who could not agree on shared intersections. We are looking at reverse commute service to bring people from rural areas into job opportunities in Brentwood and we have advocated commuter rail. And lastly, we also wrote a bicycle policy plan and major route plans to recommend to the city of Brentwood, and they, in turn, have passed as of last September an official bicycle policy, which is a precedent in the state of Tennessee. And now, they have certain policies that are promoting bicycles.

Why is this important? I think that we must restore stability, mobility to the suburbs. We have a real energy crisis. The primary source of our oil is in a region whose stability is about as stable as a sandcastle right now. We have real air pollution problems. Many areas here are non-attainment areas now. And much of the Frazier firs in the Great Smokey Mountains, which we are so proud of—they are beautiful—are dead because of air pollution problems. So, I think that all brings it very close to home why we have got to be very serious about all our solutions, including bicycles.

To do this, we have to look at a balanced transportation system that not only advocates an adequate supply of facilities, but we must manage the demand better that is placed on the system. And I think that tie—I wanted to say this to tie it together because transit—car pools, van pools, bicycles—are all mechanisms that allow you to manage the man and not just build supplies that attract better usage.

The transportation demand management, including bicycles, protects valuable infrastructure investments and it also makes economic sense, while it also reduces that air pollution and reduces reliance on foreign oil.

A TDM measure that has been vastly underutilized in this country is bicycling, both for commuting and non-work trips. Apart from walking, bicycles are the most non-polluting, energy efficient and quiet form of transportation possible, and they are ideal for short trips, which compose about 50 percent of all commute trips in the nation because short trips, because of cold starts and lower speeds, are the most polluting form of trip making. A Commute Travel Needs that we conducted in Brentwood found that almost half of the respondents live within ten miles of their work place and 18 percent live only five miles from their work place, which would be a bicycle ride of about 25 minutes and is very feasible. When people ride their bicycles to perform utilitarian tasks, which means rides other than for recreation, it eliminates a trip that would otherwise have been made by a single occupant car and also promotes physical fitness. Furthermore, it is important to note that non-work trips are increasing at a faster rate in this country than are work trips and there is fewer tools that we have to get at managing non-work trips. Bicycles are one of our best opportunities to do that. The bicycle offers one of the best opportunities to moderate suburban non-work trips. And if we create safe riding environments, many auto trips made on the part of parents to chauffeur their children to extra-curricular activities can be eliminated from the system.

However, opportunities for bicycling have to be improved and significantly enhanced if the full potential for bicycling is to realized not only in the Nashville Urban area, but nationwide. In preparation for this testimony, I reviewed the Strategic Planning Study submitted to the House last year by Secretary Skinner, and I could find very few references to bicycling. I think this reflects the fact that for the most part, prior government support for bicycling has been in the area—and has been limited to recreation trails, rather than actual commuting routes that actually link people with where they live to where they work and where they need to shop. Yet, experience shows that when adequate cycling facilities are installed that take people where they need to go, they will use them. A notable example is Madison, Wisconsin where the share of bicycle trips rose from four percent to 11 percent after they installed a system of bicycle lanes. Long-time government commitment to cycling in Denmark has resulted in that 33 percent of the nation's urban commuters bicycle to work. And I would note that in that country that expenditures for bicycle improvements exceeds those for highway road improvements.

There is much our Federal Government can do in the post-interstate era to stimulate transportation demand management, including more effective use of the bicycle as a mobility mode. If you will bear with me, I would like to mention some of these specific measures.

In the first place, setting a policy that encourages state transportation departments to take bicyclists seriously would go a long way. The September announcement by Administrator Larson of the creation of a national bicycle program manager is a step in the right direction.

Then, changing the current categorical nature of federal programs to a formula nature will add flexibility to funding sources. In other words, this will level the playing field. And rather than highway and transit type programs competing for dollars where those programs that have the best match ratios have the greatest likelihood of being funded, it is going to even—level out the playing field. And I think in the process of that, bicycles will be treated in a more balanced manner.

I think research is going to be important for all modes, including bicycles. And we need some national demonstration projects and evaluation of good practices, the best engineering designs and the impact of bicycles on congestion, pollution and energy consumption.

We need to develop new funding mechanisms that provide incentives for state and local projects to promote and provide adequate bicycle infrastructure. And perhaps an idea there is to spend down that trust fund, but dedicate certain portions or earmark them for the more innovative projects, such as bicycling.

Cities should encourage their MPOs to look for opportunities to properly design and locate new bicycle facilities as part of all planned roadway improvements and new developments and to enhance bicycle use on existing facilities. The MPOs, I believe, in the reauthorization bill are going to have to do congestion management plans. I think it is going to be important to define bicycles as an applicable activity under those congestion management plans to remind all the MPOs that this is something they can do.

I think that overall, what we are looking at in the reauthorization bill in one area is continuing to focus on the maintenance of our interstate system and devoting funds—limited funds towards strategic needs. In other words, putting funding for building totally new facilities and applying that very strategically. And then focusing in the other part on better management of the system. And if we can do that and level the playing field and add flexibility into it and define bicycles as part of the activities that should be pursued, I think we will start on the road to maybe bringing some of the European experience and success to America.

Mr. CLEMENT. Thank you very much, Ms. Davidson.

Now, Mr. Bob Saunders, President of the Nashville Bicycle Club.

[The prepared statement of Ms. Davidson appears on p. 2313.]

Mr. SAUNDERS. Congressman Clement, Mr. Anderson, thank you very much. My comments will be very brief. I do not have very much. I do not want to go over a lot of things that have been said, but I would like to say it because they kind of relate to Nashville—some examples in Nashville.

Bicyclists have a stake in the development of a sustainable transportation system. Current dependence on oil and on single-occupant car travel has led to appalling levels of congestion, air pollution and a reliance on foreign oil that cannot be sustained. Nor can these problems be solved by building more highways. If reliance is placed solely on the traditional highway system to accommodate the anticipated peak hour traffic, by the year 2010, the Nashville major street plan is calling for ten lanes on I-24 East, six lanes on Murfreesboro Road and eight lanes on Bell Road. The social, environmental and economic costs associated with projects of this magnitude are staggering, and this is just one small section of Nashville. There are plans calling for similar expansion projects in all major metropolitan areas.

The encouragement of bicycling, pedestrian and other alternative forms of transportation will help to provide some of the answers to our transportation problems. As Diane mentioned and others, statistics show that more than half the population live within five miles of their work or school, and with the increase in the number of neighborhood and regional malls, most people live within a few miles of major shopping also. Many more people would ride bicycles or walk to these areas if it were safe to do so. I could not find a single crosswalk marking or secure bicycle parking place in all of the Hickory Hollow Mall area. Yet, the automobile parking overflows onto the area streets every day during the Christmas season. Nashville Metropolitan Schools do not provide bus service to students that live within a mile and a half of the school or a mile and a quarter for grades under 5 of the school they are attending. In our neighborhood, some of the students must travel or cross Una-Antioch Pike to get to Apollo Middle School or J.E. Moss Elementary. Yet, there are no sidewalks, crosswalks, crossing guards or safe bicycling areas along this road. Situations like this only encourage the use of the automobile and nothing else.

In the current highway act, there are very few specific mentions about bicycling. More importantly, the language that does exist only permits states to spend a portion of their federal money on bicycle projects. To do so, they must decide not to spend that money on other highway projects. In other words, the money is not earmarked for bicycle use. Only 18 states have ever spent any of their federal money on bicycle projects. There is a lack of any real requirement or incentive to include provisions for bicycling—shoulders, lanes, separate paths or whatever they may be—in the design and implementation of projects funded by the Federal Government. The current law and practice still favors highway construction strictly for cars rather than the encouragement of alternatives to the automobile.

In the upcoming legislation, I encourage you to include the following:

One, a statement of policy calling for greater recognition of bicycling as a legitimate and practical means of transportation capable of helping to solve many of the environmental, social and economic problems faced by the transportation system in urban and suburban areas.

Two, stronger language to the effect that any transportation project constructed or reconstructed with federal dollars should be accessible to and usable by bicyclists, except possibly those highways where access is to be fully controlled. This should be in addition to the current language and would include both highway and transit expenditures.

And three, a requirement that states spend a minimum of three percent of their federal aid highway dollars on independent construction and non-construction of bicycle and pedestrian projects.

Thank you very much.

[The prepared statement of Mr. Saunders appears on p. 2448.]

The CHAIRMAN. Ms. Davidson and Mr. Saunders, thank you for your testimony. You may not know this, but I have been an advocate of bicycle programs going back to my early days when I was a bicycle delivery boy. In fact, in the 1982 Highway Act, I increased the federal share for bicycle-related projects to 95 percent. That is pretty good when the Federal Government comes up with 95 percent and the state only has to come up with five percent. I believe that is what it is today right now.

Next year now, we are right now working on our next year highway bill, which includes the whole business, and the entire highway bill expires this coming year, so we have to pass it. And we have been working on it this year. And next year, we will be reauthorizing the highway program. Do you have any suggestions about what should be included in that bill regarding bicycle programs? Ms. Davidson.

Ms. DAVIDSON. I think to reiterate some of my earlier comments, the post-interstate reauthorization bill provides the opportunity to build in flexibility, predictable funding and increased research and development for bicycle technology and application and specific attention should be directed towards language in sections of that act that discuss what congestion management plans will be expected of the metropolitan planning organization. I think any activities that can provide leadership from the national level to encourage the state Highway Department to begin integrating bicycles in their organizations in a more high profile manner would also be significant.

The CHAIRMAN. Mr. Saunders.

Mr. SAUNDERS. Along those same lines, I think the statement of policy calling for the greater recognition of bicycles both for transportation and in recreation. Like Mr. Sutton mentioned awhile ago, that 17-mile bike trail around Lake Pontchatrain. That is primarily for recreation, but if bicycling is encouraged for recreation, it is going to increase for transportation as well. Someone, if they get out and ride on Sunday afternoon around the lake, if that is available, they say well, maybe I will just ride to work tomorrow and it becomes a habit and it becomes something that is available. But that has got to be managed, I guess, from the top down because it has got to be safe to do so. And as we are around here, there are just very few safe places to go out and ride.

The Citizens Advisory Committee to the Metropolitan Planning Commission here—my wife is a member of that in our particular area, and she is the only person I know of at this time that has recommended some bicycle policies be incorporated into the upcoming recommendations to the Planning Commission. That includes some greenbelt areas around Percy Priest Lake, and the grand plan would include a connection all the way from the eastern side of Davidson County or Percy Priest Lake area, all the way to Williamson County, which hopefully, could connect with some of the plans that Brentwood has.

The **Chairman**. Bob.

Mr. **Clement**. Well, one of my questions was about the criteria for selecting the area for bicycle routes here in the Nashville area, including Williamson and the contiguous counties.

Mr. **Saunders**. It is very difficult to name one place I would recommend to start. There is—so much groundwork would have to be done in any of these areas to do something along those lines.

Mr. **Clement**. I understand that BATMA recommended a municipal policy for bicycling. What are some of the goals and objectives contained in that plan?

Ms. **Davidson**. I would like to address that. We first, in answer—partial answer to your first question—looked at criteria before we could actually start drawing up plans and policies. And the main thing was looking at route that would take people from place A to place B where they wanted to go, reasonably direct routes, routes that serve existing office developments and residential and recreational areas. As Bob said, if you can begin to get people to ride for recreation, eventually, you may wean them up to trips that take them—that take other trips off the road.

We also think it is important to provide ample opportunity for school-aged children to access their desired destination. And so, we look at a long-range bicycle route plan, establishing minimum design standards for improvements as you would be surprised that is something that is lacking and could use state and federal research and direction. Conducting inventories of existing conditions. And then going—using the regular public works maintenance process to make sure that shoulders are kept clear so that accidents do not occur. Making sure that grates are in the proper direction so that bicycle wheels do not get trapped in and cause serious accidents. These things are very low cost measures, but need to be addressed in a comprehensive sense to really make an impact on the system.

Mr. **Clement**. I appreciate very much both of you testifying today.

Mr. **Saunders**. Well, we certainly appreciate your support for bicycling as well.

Mr. **Clement**. Thank you. I want to do that and I want to do much more.

Mr. **Saunders**. Thank you. If we can be of any help along those lines, be sure to contact us.

Mr. **Clement**. Thank you very much for saying that.

Ms. **Davidson**. Thank you.

Mr. **Clement**. I want all of us to work together for next year on this highway reauthorization and some other ways that we can promote bicycling in Tennessee and this region of the country.

Before we adjourn this hearing—before Chairman Anderson adjourns this hearing, I know there are some others that have an interest in testifying. We have run out of time, but I do want each person that wants their testimony placed into the record to come forward, give their name, the organization that they represent and we will have your prepared statements incorporated into the record.

Thank you for also testifying today and it has been a pleasure having all of you here and I appreciate all of you for participating as you have, and this is going to be very helpful for us when we plan and have hearings for this upcoming year. And the 102nd Congress, as all of you know, commences in January of 1991.

Chairman Glenn Anderson.

The CHAIRMAN. Well, I want to thank all of our witnesses here today for their testimony, their expertise and for helping us better understand the importance of our Nation's infrastructure needs from the perspective of the state of Tennessee. I also want to thank the people of the 5th District for their warmth and hospitality. And Bob, I want to thank you for your untiring interest and support and your staff for their hard work in making today's hearing a success. With that, the Committee stands adjourned.

[Whereupon, at 5:20 p.m., the Committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

MANAGING TENNESSEE'S TRANSPORTATION INFRASTRUCTURE: A BATTLE FOR ECONOMIC SURVIVAL

Statement of Mark D. Abkowitz, Ph.D.
Administrative Director

Vanderbilt Engineering Center for Transportation Operations & Research (VECTOR)
Vanderbilt University
Nashville, Tennessee

Testimony Before
Committee on Public Works and Transportation
U.S. House of Representatives

December 7, 1990

MANAGING TENNESSEE'S TRANSPORTATION INFRASTRUCTURE: A BATTLE FOR ECONOMIC SURVIVAL

As we enter the decade of the 1990s, unprecedented social, economic and technological changes are profoundly affecting the management of transportation, and its relationship to economic development and the environment. Relaxed worldwide trade restrictions, growing environmental concerns, just-in-time manufacturing processes, and an evolution in communications technology are redefining the way in which transportation facilities are located and managed.

Here in the United States, several decades have passed since any substantial investment has been made in our nation's transportation infrastructure. Whether one is an economist tracking transportation investment and growth in the gross national product (GNP), or a regular user of the existing infrastructure, the conclusion is quite evident: **America has amassed a substantial infrastructure "deficit."**

One may ask, "What is the relationship of the current state of our transportation infrastructure to future economic survival?" The answer is rather sobering.

The 1990s will mark clearly for the first time that there is only one economic arena -- the worldwide marketplace. Global competition will be intense and additional demands will be placed on our transportation infrastructure to provide efficient, expeditious, reliable and safe service, while maintaining environmental quality. The relationship between a healthy economy and transportation system is so strong that transportation, according to the Department of Labor, occupies 24% of an average American's personal expenses, employs 11% of the U.S. work force, and represents 25% of our export dollar.

Regional Economics

While the infrastructure deficit is considered a national problem, economic impacts are generally absorbed on a regional basis. Meeting transportation needs associated with the manufacturing and distribution of raw goods and finished products, as well as personal travel requirements, determines whether an organization can compete in the international marketplace as well as the quality of life which makes a community attractive to prospective employers and employees. This is the challenge before the State of Tennessee and any other economic region in the United States.

Astronomical figures have been cited when it comes to rebuilding and rehabilitating our nation's transportation infrastructure. While some capital spending should and will be done, there will simply not be sufficient resources to adequately do the job everywhere that it is needed. Within the State of Tennessee, to remain competitive, we must seek ways to manage our transportation resources more effectively, and to bring together constituencies at the regional level that can benefit economically and environmentally by coalescing.

Key Issues

The issues presented below identify infrastructure management initiatives which must be acted upon in order for us to remain competitive within the transportation, economic, environmental and technological parameters established by this new international playing field.

(1) Communications Technology

We live in an information age, so much so that information has replaced money as the world currency. The advent of geographic information systems, satellite tracking, electronic data interchange, fiber optics and numerous other technological advances in the communications industry has introduced tremendous potential for data acquisition, information transfer, real-time monitoring and other forms of transportation decision-support. The ability to have "smart" highways and "smart" vehicles as well as dynamic traffic management and emergency response is within reach. These achievements would lead directly to greater transportation system capacity, safety and operating efficiency.

(2) Training and Technology Transfer

America's transportation workforce, many of whom came to the field while the existing infrastructure was under construction, is reaching retirement age. As these transportation professionals are being replaced, their successors must be trained to manage rather than build transportation systems. This puts new demands on our educational system to provide effective training and technology transfer. A principal focus of this new educational initiative should be the key role that information technology and decision support will play in the design, operation and efficient management of our transportation systems.

(3) Government-Industry-University Research Partnerships

Formidable partnerships involving government, the transportation industry and universities specializing in transportation disciplines have been established in Japan and Europe to gain a competitive edge in the international marketplace. Intelligent vehicle highway systems (IVHS) and the use of magnetic levitation for high-speed rail are but two examples of foreign collaborative efforts. In the U.S., these same organizations have been working on parallel streams rather than in unison, contributing to a net loss in creativity, productivity, synergism and resource sharing. This trend must be dramatically reversed.

(4) Interdisciplinary Approaches to Problem-Solving

The management of transportation problems has grown in complexity over time, requiring a more interdisciplinary approach to problem-solving and decision-support. The management of technology that will be necessary to improve the transportation infrastructure will involve, at a minimum, engineering, management, economic, public policy, legal and health science input and interaction. An effective mechanism to encourage the collaboration of individuals specializing in these disciplines, focused on transportation problems, is sorely needed.

(5) Regional Transportation Strategic Planning

The regional economic "crisis" which is developing from transportation infrastructure deficiencies must be confronted by constituencies who are directly impacted, such as shippers, carriers, state and local authorities, service providers, financial planners, legal representatives, commercial developers, educators and public interest groups. This perhaps unlikely group of partners must coalesce to examine a region's transportation, economic and environmental objectives, identify challenges in meeting these goals, identify resources available to the region, evaluate the competition which may be capable of achieving similar goals in other regions, and develop a critical path of short and long-term strategic initiatives necessary to successfully achieve the stated objectives.

This will require a new way of thinking for some groups within such a partnership, because the element of unity is regional viability, and not environmentalist vs. industrialist, trucking vs. rail, or innovator vs. traditionalist. The issue is Tennessee vs. other economic regions in the U.S., or more importantly, Tennessee vs. economic regions in Europe, Asia and other parts of the world.

What Is Government's Role?

Several national transportation initiatives must be undertaken to serve as a catalyst to restore U.S. competitiveness. In practical terms, these initiatives translate into policy changes and "seed" funding in support of program implementation.

A broad national research and development program is needed to harness communications technology to our competitive advantage. America is lagging behind foreign competitors in developing these capabilities, bringing products to the transportation marketplace, and realizing productivity and efficiency gains through their subsequent implementation.

Funds must be set aside to develop a curriculum which educates the future transportation professional and re-trains current transportation employees so as to be prepared to successfully manage in this new era. The Vanderbilt Information Systems in Transportation Academy (VISTA), an advanced institute for transportation management funded by the U.S. Department of Transportation, is one such example. Through VISTA, several highly-skilled professional men and women have returned to pursue advanced degrees in a number of disciplines related to transportation.

Tax credits or some other form of financial incentive should be established to promote the formation of government-industry-university partnerships in order to pursue research and development in transportation. My colleagues and I have experienced expressions of surprise from several senior transportation executives concerning the unique capabilities of university researchers to address their management problems, and regret for not having established a formal relationship some time ago. These barriers and stereotypes must disappear, and the Federal government has a responsibility in effectuating such change and participating in the partnership.

Responsibility for the conduct of regional strategic transportation plans and the subsequent implementation of recommended actions should be borne by individual regions. They would be the economic benefactors and are the largest stakeholders. However, Federal funds set aside for demonstration projects which regions could obtain in order to develop prototype strategic planning efforts would hasten the adaptation of this approach to better serve U.S. regional economic interests.

In closing, I would like to emphasize one final point. Many of the challenges before us in managing our transportation infrastructure to competitive advantage are based on worldwide factors that are well beyond the control of domestic government policy. Consequently, the focus of Federal transportation program policy, in order to be effective, must be in providing opportunities to enable U.S. industry to compete on a level playing field in this battle for economic survival.

TESTIMONY BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

NASHVILLE, TENNESSEE

DECEMBER 7, 1990

BY WESS BALL

TENNESSEE HIGHWAY USERS CONFERENCE

Mr. Chairman, my name is Wes Ball. I am President of the Tennessee Grocers Association and a member of the Tennessee Highway Users Conference. I'm here to present the prepared statement for the Conference. We are pleased to be here and appreciate the high priority you're giving this important issue of "Tennessee's Infrastructure Needs."

The Tennessee Highway Users Conference is a statewide non-profit organization comprised of diverse membership to include hotels & motels, auto clubs, farm groups, petroleum and rubber groups, trucking companies, safety interests, outdoor advertising, grocers, automobile dealers and others. Our purpose is the development and maintenance of a good highway transportation system -- to include the roadway, the driver, the vehicle and energy.

We commend you Mr. Chairman and Congressman Clement for bringing the Committee to Tennessee and we welcome you. We welcome you with the 43 million other travelers that come to and through Tennessee each year. These visitors spend $4 billion annually with us. There is a real direct linkage between these visitors--their dollars and Tennessee's infrastructure needs. Eighty one percent of our visitors come by highway.

Tennessee Highway Users support the development and designation of a National Scenic Byways System. In 1982 our state designated a 2300 mile Tennessee Parkway System. We'd like to see that system intergrated into a national system for promotion, designation and standardization. Our hundreds of small towns would also benefit from this tourism business. Seventeen percent of our miles of travel is for leisure and recreation. These travelers would benefit from this system.

Tennessee Highways are Tennessee's economic lifeline. Nissan, Saturn, Kellog, Eastman, Shoney's, Malone & Hyde and thousands of other companies depend on good highways to carry their employees to work and their products to market.

Forty percent of our bridges are deemed deficient. Three hundred highways are identified as being in need of major improvements over the next 10-15 years. The total bridge and highway maintenance need by the year 2000 is over $10 billion.

An infrastructure need for Tennessee is an assured funding source for our highway system. The user fee---pay-as-you-go has provided us with a highway system that's the envy of many. We need that user fee left in place without such diverson measures as those passed by the recent Congress when motor fuel tax was used to reduce the deficit.

Tennessee's infrastructure needs could be well served by the release and expenditure of the $17 billion balance in the Highway Trust Fund.

Congestion, bad roads and poor traffic control and management increase traffic accidents and the cost of transportation. Our state experienced 1,088 traffic facilities in 1989 --- 2.2 deaths per 100 million motor vehicle miles. Slightly below the national average of 2.3. With road travel increasing 4% per year nationally, the death toll could reach 80,000 by the year 2000 at this present death rate. We are participating in a national effort to get the rate down to 1.8 by the year 2000. Tennessee needs a good road network system to contribute to this reduced traffic death rate.

Mr. Chairman and members of the Committee as you well know Reauthorization of a 1992 Highway Program must occur by September 30, 1991. We urge your attention and action on this matter early into 1991 in order that continuous and smooth operation of our nation's highway transportation system can occur.

Thank you for hearing our statement.

Diane Davidson

PREPARED STATEMENT OF DIANE DAVIDSON
BRENTWOOD AREA TRANSPORTATION MANAGMENT ASSOCIATION
Bicycle Comments for ReAuthorization Hearing
December 7, 1990

Thank you for the opportunity to comment on the shaping of the new national transportation program. I represent the Brentwood Area Transportation Management Association which is a partnership formed in 1988 between the public and private sector to provide leadership in the mitigation of suburban traffic congestion. Our goal has been to promote strategies and activities that provide congestion relief and we have received national recognition for our innovation and success.

There is a very real congestion crisis facing the United States and this Nashville urban area. Recent Major Route Plans in Nashville and Brentwood show present and future unacceptable levels of delay on the interstate and local highway systems. Building enough capacity to provide for future needs is limited by right of way and construction cost and environmental issues. At the same time, air pollution, global warming and energy shortage concerns threaten the quality of our lives. A major issue in the new policy will be how do we restore mobility to the suburbs.

A balanced transportation system that can take America through the next decade and beyond must not only emphasize an adequate supply of new facilities but must also manage the demand that is put on the system. Transportation Demand Management (TDM) activities protect valuable infrastructure investment and extend the capacity of existing roads. TDM makes economic sense while also reducing air pollution and reliance on foreign energy sources.

A TDM measure that has been vastly underutilized in this country is bicycling, both for commuting and non-work trips. Apart from walking, bicycles are the most non-polluting, energy efficient, quiet form of transportation possible and are ideal for short trips. Bicycles are an ideal mode for commutes under 10 miles which is great because short auto trips are also the most polluting. A Commute Travel Needs and Commute Patterns survey of Brentwood area employees found that almost half of the respondents live within 10 miles from their worksite and 18% live only 5 miles or less from their work, a bike ride of about 25 minutes.. When people ride bikes to perform utilitarian tasks, it eliminates a trip that would have been made by a single occupant vehicle and also promotes physical fitness. Furthermore, non-work trips are currently increasing at a faster rate than work trips due to our lifestyles, new demographic trends and land use patterns. It is very difficult to manage these trips in the sense that we manage work trips through employer rideshare programs. The bicycle offers an excellent opportunity to moderate suburban non-works trips. If we created safe riding environments, many parental auto trips could be eliminated as children could bicycle to afterschool or weekend activities.

However, opportunities for bicycling have to be improved and significantly enhanced if the full potential of bicycling is to be realized in the Nashville Urban area and nationwide. In preparation for this testimony, I recently reviewed the National transportation Strategic Planning Study submitted to the House of Representatives by Secretary Skinner last

March. The document accurately portrays the urban and suburban congestion crisis, air pollution, global warming, demographic trends and environmental problems that require rethinking of the way we travel. Among the primary issues of concern under the highway system were safety, traffic congestion and need for greater reliance on transportation demand management. So far so good - But no where in the 300 page document could I find any mention of bicycle as a mode to promote. This reflects the fact that for the most part, government support for cycling in this country has been limited to recreational trails rather than useful commuting routes that link places where people live to where they shop and work. Yet experience shows that when adequate cycling facilities are installed that take people where they need to go, they'll use them. A notable example is Madison, Wisconsin where the share of bicycle trips rose from 4% to 11% after installing a system of bicycle lanes. Longtime government commitment to cycling in Denmark has resulted in that 33% of the nations urban commuters cycle to work. There is much our Federal government in the post-interstate era to stimulate TDM including more effective use of the bicycle as a mobility mode:

*setting policy that encourages state transportation departments to take bicycles seriously. The September announcement by Administrator Larson of the creation of a national bicycle program manager is a step in the right direction;

*changing the current categorical nature of federal programs in recognition of changing travel demands, severe air quality problems and need for new solutions will add flexibility and may result would result in a source of funding for bicycles.

*providing support for research, national demonstration projects and evaluation of good practices, engineering designs, and the impact of bicycles on congestion, pollution and energy consumption;

*developing new funding mechanisms that provide incentives for state and local projects to promote adequate bicycling infrastructure;

*Cities should be encouraged through the MPO to look for opportunities to properly design and locate new bicycle facilities as part of planned roadway improvements and new developments and to enhance bicycle use on existing facilities. I know of no better way to accomplish this than through funding incentives.

*New federal funding programs should be flexible enough to support local ridesharing efforts.

*Hope to see better coordination of investments in one part of the urban system with those in other parts so that the whole works together better. This kind of investment strategy will require flexibility in the of funds irrespective of system ownership.

*conducting and funding research and development into why the bicycle is an underutilized mode in this country in order to then develop strategic national goals for increasing its use. Adequate resources must be provided to implement the goals.

*the bicycle may have the greatest potential in suburban areas where congestion is approaching crisis proportion so make sure that cycling, along with vanpooling, carpooling, transit, is an element that must be considered in MPO congestion management action plans.

*Local Planning Commissions should be encouraged through education materials to include cycling into the suburban transportation environment.

*On state levels, Impact Fee Legislation provides credits for developers who contribute road improvements but neglects to give credits for TDM type contributions. This should be amended at the earliest opportunity.

*The new highway funding programs should provide incentive, such as better matching ratios, for local and state governments to try creative supply and demand management solutions, such as HOV lanes, ramp metering, Park and ride lots, bike sensitive signal detectors. Improving safe cycle access to and through areas that otherwise would be too dangerous, such as underpasses or bike bridges should receive priority treatment.

*Provide an equitable distribution of funds so that the interstate system is well maintained and suburban and air quality problems are addressed.

*Include incentives through the MPO process that reward better coordination of local land use and transportation.

The Brentwood City Commission, in recognition of the growing interest in bicycle transportation passed a Resolution last September and will incorporate a Bicycle Route Plan as a sub-element of their upcoming Collector Plan.

In summary, the new National Transportation Policy recognizes bicycling as one of the alternatives to driving along but has yet to allocate meaningful funding for bike facilities and education. A post-interstate Reauthorization Bill provides the opportunity to build in flexibility, predictable funding, and increased R & D for improved technology and decision making will serve not only bicycle but highway, transit and rideshare interests. BATMA, the City of Brentwood and the cycling public appreciate the Congressman's interest in commuter cycling and the opportunity to address this group today.

TESTIMONY BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

NASHVILLE, TENNESSEE

DECEMBER 7, 1990

BY THE HONORABLE GENE DAVIDSON

TENNESSEE GENERAL ASSEMBLY

I am Gene Davidson, a member of the Tennessee General Assembly and a farmer. In my official capacity in the General Assembly, I am a 16 year veteran of Finance, Ways and Means, and chairman of the House Education Committee and serve as Joint Chairman of the Select Oversight Committee on Education.

I am a resident of Robertson County which is a county adjacent to Metro Davidson County. During my tenure in the General Assembly I have seen the area which I represent emerge from a rural county to now a suburban county.

The needs of the area of Robertson and Cheatham county have changed over the years quite dramatically. With growth we have faced new challenges as you can quite imagine. Some of the challenges we have been able to handle, while others we as an area have not been as successful.

Our area infrastructure has to be improved. There are areas of the district I represent that are stymied by the fact that they cannot afford to implement sewage systems, or expand existing sewage systems. The same is true with existing water systems that cannot handle the growth. Our local governments and the state can only afford a limited degree of expansion because of demands that have arisen due to growth and transferred responsibilities. Environmental legislation, while although beneficial, has placed new financial burdens on infrastructures.

Alas, yes transportation. Transportation is without saying perhaps the most important link that we all have to the rapidly changing world.

Our state has tried to improve the highway systems all across this fair land. As you well know it is a timely and costly proposition. In many instances our effort has been behind development, especially in rural areas and suburban areas.

Highway development in the district that I represent has run into many obstacles. Many of those obstacles were in fact the relocation of portions of our infrastructure such as water lines and sewage lines. The local governments could not afford to relocate these systems because of the cost. To further compound the problem, there was the absence of a structure in place to iron out these difficulties of state versus local conflicts. It is a take it or leave it proposition.

We in the hinterlands are also faced with the problem of a coordinated effort to link our highway systems as far as improvements with the larger metropolitan areas. With the larger cities faced with their respective traffic flow problems, there has been little inititiative on the part of larger metro areas to join in a united effort with satellite areas to address the needs to the outlying suburban areas in making access easier. A case in point in the district I represent is Highway 431.

We in the areas surrounding Davidson County recognize the need for a northern beltway around Nashville linking Interstates 40, 24, and 65. All of these arteries are heavily traveled and all end up at square one which is Nashville thus creating a major bottleneck. The situation is terrible today and by the year 2000 will be disastrous unless something is done.

The project, I-840 North, is too costly for the State to take on alone. In this situation we must have Federal assistance.

In summation, I bring to you for your information two points already alluded in my statement. First, we need assistance or advice in coordinating projects. Second, we need Federal assistance at least at the current rate of funding. Without it our existing infrastructure will crumble even further and new programs and projects will die on the vine.

I know of the budget woes that you face daily in Washington. However, the money that you spend on the highway system in this country equates into more jobs for developing communities. More jobs equates into more tax revenue.

Thank you very much.

U.S. House of Representatives
Committee on Public Works and Transportation

December 7, 1990

Statement of

Ron E. Gant
President

Tennessee Trucking Association, Inc.

Mr. Chairman, Members of the House Public Works and Transportation Committee, welcome to Tennessee. Thank you for this opportunity to present testimony before the Committee. The subject of today's hearing, the nation's and more explicitly Tennessee's infrastructure needs, is one of paramount importance to the trucking industry, but even more fundamentally to our nation, its people and our way of life.

The economic health of Tennessee is vitally linked to trucking. A quick view at some of the more basic facts concerning the industry in Tennessee will underline trucking's prominent role in Tennessee's economy. According to the 1988 data, the industry:

- Employed more than 150,000 persons
- Had payroll in excess of $2.8 billion
- Serves all of Tennessee's populated communities, 75% of which have no other commercial transportation
- Had a growth of 15,700 jobs from 1985 to 1987
- Paid over $500 million in state and federal highway taxes-nearly $10 million a week
- While heavy trucks constitute only 1.4% of all vehicles registered in Tennessee, they paid 38.9% of all highway user taxes
- Heavy trucks paid 45 times the state and federal highway taxes of the average car in Tennessee
- Trucks hauled over 70% of the manufactured goods transported into and out of Tennessee.

Our nation and more specifically Tennessee has been well-served by the Federal aid highway program which has provided for the development of our national highway system. Keeping in mind Tennessee's location within one day's drive of 70% of the nation's population, Tennessee has become a distribution center that has greatly benefited from the interstate and the federal highway systems. In addition, Tennessee has undertaken an aggressive road program to ensure access to and from the interstate system for all Tennesseans.

Yet with all of the system development undertaken, we do not today have the plan in place to meet our highway infrastructure needs into the 21st Century. The new Federal highway program to be addressed in 1991 must use as its foundation the National System of Interstate and Defense Highways and major primary highways of significance. This system must be complimented with arterial routes for access.

This "new system" of highways, referred to as the Highways of National Significance, must be upgraded in design and construction to carry the increased volume of traffic including a major portion of the commercial traffic in Tennessee and the nation. In addition, there must be continuing federal support for those routes not on the National system, as these routes often are the origination and terminal routes for many shipments which will use the National system.

Of major concern to Tennessee trucking firms has been the policy of building balances in the Highway Trust Fund for Federal budget deficit reduction purposes. This policy has ensured that we have neglected necessary new road projects and have failed to maximize our maintenance of the existing system. We must not continue a policy of collecting a user fee for a specific purpose and then fail to expend it for the purpose for which it was collected where there is demonstrated need. It is the position of the Tennessee Trucking Association that the Trust Fund should be "spent down" and that the 2.5 cent Deficit Reduction fuel/gasoline tax be turned over to the Trust Fund in 1995. Only then will the concept of a user fee be restored. And, while we are at it, under the user fee concept, why not abolish the current exemptions for gasahol? Users are users, regardless of the type of fuel, and all gaschol users should financially support our highway system's development and maintenance at the same level as fossil fuel users currently do.

Also at focus here is the increasing pressure to divert user fee/Trust Fund dollars for non-highway purposes. This once again attacks the fabric of the user fee concept and is one to which we as an Association and industry are opposed. We must first see the financing mechanism that was built our road system not become used for other purposes, regardless of worthiness, prior to increasing taxes.

And, where does the Tennessee Trucking Association stand on the issue of increased federal fuel taxes next year? Until the current Trust Fund balance is drawn down and the aforementioned 2.5 cents is turned over to the Trust Fund, the membership remains steadfastly opposed to any fuel/gasoline tax increase.

The Tennessee Trucking Association is concerned about the most cost effective application of highway tax dollars. In this vein, we would suggest that increased attention be given to the studies which indicate a disproportionate increase in life expectancy of highways with thicker pavements. The American Association of State Highway and Transportation Officials (AASHTO) reports that one additional inch of concrete pavement doubles the strength of the pavement and the life expectancy as well. Yet the cost of that 1 inch adds only 4% to the construction cost and less than 1% to the total project costs on the average rural interstate.

Carrying pavement thickness to 14" from the traditional 10" would yield eight times the durability while adding only 2% or less to the total construction costs. Why not use this technology to increase the long term value of the highway user tax dollar which we in the industry like to view as a capitol investment not unlike others which we make.

The subject of increased truck productivity is one that is receiving intensified attention as the Highway Reauthorization deadline approaches. The Tennessee Trucking Association believes that there are two productivity elements which merit serious consideration. Both are part of the report to Congress earlier this year by the Transportation Research Board. Those items are:

- The allowance of states to permit weights above the 80,000 pound threshold with permit fees commensurate with the associated additional costs; and
- A liberalization of the federal bridge formula to benefit trucks with shorter wheel bases.

A secondary development from these two recommendations would be the probable addition of axles on the traditional five axle tractor/semi trailer combination vehicle which would result in increased productivity without changing current axle limits. The positive impact upon costs and the environment would be substantial.

There is one other topic of major importance that must not be ignored as we plan for the future. Safety on our nation's highways, especially in commercial vehicles, has increased substantially in the past ten years. Fatality rates have declined significantly. The federal-state commercial safety enforcement program known as the Motor Carrier Assistance Program is a major factor and must receive additional funding for inspectors and training. In addition, increased commitment to research on safety design factors and driver performance will pay dividends not only to the trucking industry but also to the general motoring public.

In conclusion, the Tennessee Trucking Association believes that deliberate consideration of all of the objective factors on the issue must be the foundation of the Highway Reauthorization Act of 1991. A strong national highway system funded primarily on the federal level without shifting the responsibility to state and local governments is in the best interest of transportation in this state and nation. When one takes the broader view that our economy is certainly transportation dependent and international in scope, the dynamics increase, but so should the commitment for practical solution. We commend the House Committee on Public Works and Transportation for coming to Nashville and seeking Tennessee's view on this very important topic of consideration by the Congress in 1991.

TESTIMONY BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

NASHVILLE, TENNESSEE

DECEMBER 7, 1990

BY MS. GWEN HOPKINS

INFORMATION OFFICER

TENNESSEE DEPARTMENT OF TRANSPORTATION

Good afternoon, Chairman Anderson, Congressman Clement and members of this committee. Thank you for the opportunity to address you on behalf of the Tennessee Department of Transportation, on a matter of very grave concern to me, and to the citizens of this state.

I regret that I am unable to appear before you in person, but I am on my way to attend the annual meeting of the American Association of State Highway and Transportation Officials, an organization of appointed and elected leaders like myself who represent the Transportation Departments from all 50 states. At that meeting, we'll be discussing a number of transportation issues, and attempting to fine-tune a platform of recommendations intended to assist you and your colleagues next year as you begin planning for the reauthorization of a new national Surface Transportation Act.

As a state transportation official, I must tell you that the 5-cent federal gas tax increase, which took effect last Saturday, was a bittersweet pill to swallow. The decision to increase 1991 spending levels by more than $2 billion, and drawing off some of the more than $10.5 billion that's in the Highway Trust Fund, is commendable.

But all -- not half -- of the 5-cent increase should be dedicated to transportation needs. As a nation, our highways need to be maintained, our bridges are old and in need of rehabilitation and replacement, even many of our interstates are rapidly becoming worn and out-dated. To keep up the current system, we'll need $80 billion. Tennessee is united with the other 49 states in the belief that the federal government should share more of the burden, spend down more of the Highway Trust Fund monies, and dedicate highway user fees to transportation and nothing else.

Tennessee has one of the highest state gasoline taxes in the country -- at 20 cents per gallon. The Department of Transportation receives nearly 61 percent of those revenues. Most of the remainder goes to city and county governments. We've increased our state gas tax twice in the past four years -- the total amount of 8 cents per gallon -- in order to pay for a 13-year, $3.3 billion road-building and improvement program. We have highway construction projects underway literally from one end of this state to the other.

But that program only addresses needs on Tennessee's primary system. Our interstates are suffering from wear and tear and, especially in many of our urban areas, are operating beyond capacity. This is happening at a time when we've seen our annual allocation of 4-R money seesaw -- in FY 1987, Tennessee received $72.4 million; the following year it dropped to $61.3 million. Since then, it's been creeping up slowly to our current balance of $63 million. Next year, we anticipate getting $63.7 million toward the upkeep of a little over 1,100 miles of interstate highways in Tennessee.

An area where we've seen a more dramatic pattern of funding reductions and inadequacy is our bridges. Like most other states, Tennessee's primary funding source for rehabilitating and replacing bridges is the Federal-Aid Bridge Replacement Program. In just three short years, we've seen this program cut $16 million, from $50.2 million in FY 1988 to $34.2 million this year.

Unfortunately, we in Tennessee know first-hand what can happen when too-little funding is spread dangerously thin. On April 1, 1989, a 50-year-old bridge on U.S. 51 over the Hatchie River collapsed, claiming the lives of eight Tennesseans.

Since that tragedy, the State of Tennessee has looked for ways to shore up our efforts in bridge safety, and fill in the gap left by reduced federal bridge money. Early this year, Governor McWherter announced a new off-system bridge program to assist local governments in the maintenance and replacement of their bridges. Our Legislature approved first-year funding for this 10-year, $100 million program, and it became effective on July 1. The Department let the first replacement contract under this program on August 30.

Of Tennessee's 18,711 bridges, more than half are off-system bridges. We believe that between 150-175 deficient local bridges can be repaired annually with this new program, and that's a step in the right direction.

Under our Federal-Aid Bridge Replacement Program efforts, we are working to systematically address needs on bridges that are too narrow and that are posted for lower load limits.

Our current budget includes $7.5 million more for contract bridge repairs, and we have hired outside consultants to supplement the work of our in-house personnel in preparing repair plans. This will enable us to let more repair contracts for bridges this year than last year.

Like other states, Tennessee has had to begin searching for ways to make up for the increasing shortfall in federal funds. State and local governments now shoulder 78 percent of this country's total highway spending, as compared to the federal's contribution of only 22 percent.

As Congress begins preparing for reauthorization next year, strong consideration should be given to providing immediate increases in Federal-Aid Bridge Replacement, Interstate 4-R and every other federally funded program.

Perhaps the single most important change I would like to see in the new transportation act for 1991 is the so-called "Minimum Allocation" provision. As you know, this provision was included to ensure that each state receives no less than 85 percent of the money it pays into the Highway Trust Fund. The problem is discretionary monies, emergency relief, demonstration projects and such are counted against the minimum allocation apportionment. Tennessee is a "donor" state, meaning we pay more into the Highway Trust Fund than we receive back through federal apportionments. When a discretionary bridge grant, or emergency relief funds are counted in with our minimum allocation, it means we're not really getting our fair share. States that are not "donors" are not penalized in this way when they get discretionary monies.

Funds received through special grants should be in addition to federal funds we are entitled to through regular apportionment formulas. Tennessee would like to see the guaranteed minimum return to states be in the 90-to-95 percent range in the new legislation, with no penalty for any additional special funding which might be received. I have already contacted each member of Tennessee's Congressional delegation to ask for their assistance in correcting this inequity, and today, I'm respectfully asking the members of this Committee to give it strong consideration, as well.

The national association I mentioned a moment ago -- AASHTO -- estimates we will need $100 billion to meet increased demands and point us in the right direction for a prosperous future. Any further diversion of highway user fees, and further delay in releasing monies accumulated in the Highway Trust Fund, deprives our nation's transportation system of badly needed revenue. Enactment of a new Surface Transportation Act -- with fair and equitable distribution for all 50 states -- should be at the top of the Congressional agenda next year.

Thank you for your time, and again, for the opportunity to address you here today.

TESTIMONY BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
NASHVILLE, TENNESSEE
DECEMBER 7, 1990

BY DANIEL D. LANE, CHAIRMAN
METROPOLITAN TRANSIT AUTHORITY
METROPOLITAN DAVIDSON COUNTY

THANK YOU FOR THE OPPORTUNITY TO DEFINE THE PROSPECTS OF TRANSIT IN THE FEDERAL REAUTHORIZATION OF SURFACE TRANSPORTATION.

IN THE LAST THIRTY YEARS, THE NASHVILLE AREA SURFACE TRANSPORTATION SUPPLY HAS BEEN PERMANENTLY CHANGED BY THE CONSTRUCTION OF INTERSTATE HIGHWAY SEGMENTS I-24, I-65, I-40

AND I-440. DURING THE THREE DECADES OUR POPULATION, EMPLOYMENT, AND ECONOMY HAVE DOUBLED.

DURING THE NEXT THIRTY YEARS, THE POPULATION, EMPLOYMENT AND ECONOMY OF THIS REGION WILL ONCE AGAIN DOUBLE. DESPITE EXTENSIVE INVESTMENT IN NEW HIGHWAYS, THE SURFACE TRANSPORTATION CAPACITY EXPANSION OF THE PAST THREE DECADES WILL NOT BE DUPLICATED IN THE COMING THIRTY YEARS.

URBAN AND SUBURBAN MOBILITY CAN AND MUST BE PRESERVED. AIR QUALITY MUST NOT BE SACRIFICED. ENERGY CONSUMPTION PER PASSENGER MILE MUST BE DRASTICALLY REDUCED.

YOU WILL HEAR A GREAT DEAL OF TESTIMONY REGARDING THE AMOUNT OF HIGHWAY SUPPLY INVESTMENT WHICH IS ESSENTIAL TO OUR NATION. YOU WILL HEAR A SMALLER QUANTITY, BUT NO LESS IMPASSIONED APPEAL FOR GREATER SUPPLY OF

TRANSIT DURING THE PERIOD OF THE NEXT REAUTHORIZATION.

WE RESPECTFULLY ARGUE FOR A DIFFERENT APPROACH. TRANSPORTATION SOLUTIONS REQUIRE MORE COMPREHENSIVE APPROACHES THAN MORE CONCRETE OR MORE RAIL. DURING THE NEXT DECADES PRESERVATION OF OUR ECONOMIC COMPETITIVENESS WILL DEMAND IMPROVEMENT NOT MAINTENANCE OF CURRENT MOBILITY STANDARDS. OUR FEDERAL SPENDING REALITIES WILL NOT ALLOW LARGE INCREASES IN REAL SPENDING. RATIONALLY PROJECTING OUR NEEDS AND CAPABILITIES, GREATER MOBILITY MUST BE SQUEEZED FROM FEWER REAL DOLLARS. COMPREHENSIVE MOBILITY SOLUTIONS MUST COMBINE THE FOLLOWING:

MORE FREEWAYS
MORE TRANSITWAYS
MORE RAIL LINES
MORE HIGH CAPACITY VEHICLES
SMARTER ROADWAYS
GREATER DESIGN FOR PEDESTRIAN MOVEMENT
CAREFUL URBAN DESIGN
BALANCE OF HOUSING AND EMPLOYMENT

IN A CONSTANT ENVIRONMENT THESE SOLUTIONS WOULD BE DIFFICULT; IN AN ENVIRONMENT OF LESS PETROLEUM AND GREATER POLLUTION THIS CHALLENGE IS FORMIDABLE. DEBATE OVER TRANSPORTATION SUPPLY MUST ALSO EVALUATE TRANSPORTATION DEMAND AND URBAN FORM.

ENERGY AND AIR QUALITY

ANDREW KIMBRELL OF THE FOUNDATION OF ECONOMIC TRENDS STATES:

> "IN THE UNITED STATES ALONE, WE COULD SAVE 33 MILLION GALLONS OF GASOLINE EVERY DAY AND SIGNIFICANTLY REDUCE AIR POLLUTION IF THE AVERAGE COMMUTER PASSENGER LOAD WERE INCREASED BY ONE PERSON."

THE C.A.F.E., CORPORATE AVERAGE FUEL ECONOMY, TARGETS HAVE RECEIVED WIDE SPREAD ATTENTION. CERTAINLY, INCREASING THE C.A.F.E. AT THE MANUFACTURER LEVEL IS A PART OF OUR ENERGY

CONSUMPTION RESPONSE. BUT INCREASING THE C.A.F.E. 50% REQUIRES EITHER TECHNOLOGICAL CHANGES OF A MAGNITUDE DIFFICULT TO ACCEPT BY MANUFACTURERS, OR A SHIFT IN PRODUCT MIX TO SLOWER, LIGHTER WEIGHT AUTOMOBILES. NEITHER ARE EXTREMELY POPULAR.

WE MAY MAINTAIN OUR LOVE AFFAIR WITH THE SPIRITED AUTOMOBILE IF WE MODIFY THE INCENTIVES TOWARD ITS USE. IN SAN FRANCISCO, PRIVATE SECTOR LEADERS HAVE CALLED FOR A POLLUTION TAX. BY INJECTING MARKET FLEXIBILITY RATHER THAN REGULATORY MANDATES TO THE REDUCTION OF AUTOMOBILE EMISSIONS, SOME CONSUMERS WILL OPT FOR HIGHER TAXES, SOME FOR RIDESHARING, AND SOME FOR NEW POLLUTION ABATEMENT TECHNOLOGY. FROM A PUBLIC FINANCE PERSPECTIVE, POLLUTION TAXES ARE A MOST LOGICAL SOLUTION TO PRICING THE NEGATIVE EXTERNALITIES ASSOCIATED WITH REDUCED AIR QUALITY. TRANSIT PROVIDERS ARE OFTEN CALLED TO DEFEND THEIR "SUBSIDIES." YET CURRENTLY, THE COST OF OUR DECAYING AIR IS CHARGED TO NO

ONE. THE COMMON PERCEPTION IS THAT FUEL TAXES PAY FOR ROAD CONSTRUCTION. THE AVERAGE CITIZEN BELIEVES THAT ROAD USERS ARE NOT SUBSIDIZED BY GOVERNMENT SPENDING.

THE CONSERVATIVE DILEMMA, AS GEORGE WILL PUT IT, IS THAT THE SOLUTION TO CONGESTION IS MORE FREEWAYS, BUT THE TEMPORARY CONGESTION EASE REQUIRES GREATER TAX BURDENS, AND IN THE END IS MET BY RENEWED CONGESTION.

IT SEEMS THAT DURING EACH ENERGY CRISIS OUR NATION REDISCOVERS BASIC TRANSPORTATION ENERGY FACTS. BUT DURING THE LAST TWO ENERGY CRISES, THE END OF THE TEMPORARY SHORTAGE MEANT THE END OF POLITICAL COMPULSION FOR IMPROVEMENT. THIS TIME THINGS ARE DIFFERENT. FIRST, ONE HALF MILLION TROOPS ARE AT RISK. SECOND, GLOBAL WARMING AND HEALTH IMPLICATIONS OF POOR QUALITY AIR SUCH AS THAT OF LOS ANGELES LEAD RATIONAL, MODERATE VISIONS IN A NEW DIRECTION.

UNDER NORMAL LOADING CONDITIONS, NOT CAPACITY LOADING CONDITIONS, THE SINGLE OCCUPANCY AUTOMOBILE GENERATES 21 KILOGRAMS OF HYDROCARBONS, 151 KILOGRAMS OF CARBON MONOXIDE AND 21 KILOGRAMS OF NITROGEN OXIDES DURING 10,000 PASSENGER MILES. IN THE CASE OF CARPOOLS THE HYDROCARBONS ARE REDUCED TO 7 KILOGRAMS, CARBON MONOXIDE TO 50, AND NITROGEN OXIDE TO 7. BUS TRANSIT YIELDS 2 KILOGRAMS OF HYDROCARBONS, 31 KILOGRAMS OF CARBON MONOXIDE, AND 15 KILOGRAMS OF NITROGEN OXIDES FOR THE SAME PASSENGER TRAVEL. RAIL TRANSIT, THE MOST ENERGY AND AIR EFFICIENT, YIELDS ONE TENTH OF ONE KILOGRAM OF HYDROCARBONS, TWO TENTHS OF ONE KILOGRAM OF CARBON MONOXIDE, AND 5 KILOGRAMS OF NITROGEN OXIDES.[1]

---

1 AMERICAN PUBLIC TRANSIT ASSOCIATION, MASS TRANSIT, THE CLEAN AIR ALTERNATIVE, 1990, WASHINGTON, D. C.

THE ENERGY AND AIR QUALITY IMPACTS OF OUR URBAN AND SUBURBAN LIFE ARE PUT IN MOST CLEAR PERSPECTIVE BY COMPARING ENERGY CONSUMPTION IN CITIES OF MUCH DIFFERENT FORM. LOS ANGELES, DENVER, PHOENIX, AND HOUSTON ARE AMONG THE WORST ENERGY CONSUMERS PER CAPITA. NEW YORK, CHICAGO AND BOSTON ARE IN A DIFFERENT STRATUM OF ENERGY USE PER CAPITA. ZURICH, BERLIN, AND VIENNA ARE IN STILL ANOTHER. THERE IS NO COINCIDENCE IN THESE PATTERNS. THE LATTER STRATA WERE LARGE URBAN CONCENTRATIONS BEFORE THE AUTOMOBILE. THE MIDDLE STRATA WERE SIGNIFICANT CITIES BEFORE THE AUTOMOBILE WAS POPULARLY ACCESSIBLE, BUT HAVE GROWN A GREAT DEAL SINCE. THE "MODERN" CITIES SUCH AS HOUSTON AND LOS ANGELES HAVE EXPERIENCED THE PREDOMINANT PORTION OF THEIR GROWTH SINCE THE AUTOMOBILE DESIGN FEATURES OF AMERICAN LIFE BECAME COMMON.

THE DESIGN OF OUR CITIES IS A MORE IMPORTANT PART OF THE SOLUTION THAN ANY BUDGET DECISION BETWEEN HIGHWAYS AND RAILS. THE AUTOMOBILE IS A SYMBOL OF FREEDOM OF CHOICE IN MOVEMENT, BUT THERE IS NOTHING EXALTING ABOUT A TRAFFIC JAM. THE AUTOMOBILE MAKES LIFE MORE PRODUCTIVE FOR MILLIONS OF AMERICANS, YET THERE IS NOTHING PRODUCTIVE ABOUT THE TWO BILLION HOURS A YEAR WHICH ARE WASTED IN TRAFFIC CONGESTION. CAR TELEPHONES HELP US COPE, BUT BETTER DESIGNS FOR CITIES ARE MORE THAN BAND-AID SOLUTIONS.

THE HIGHWAY BUILT TODAY EASES CONGESTION TODAY AND REKINDLES CONGESTION TOMORROW. BUILDING CITIES IN WHICH PEDESTRIANS ARE FOREMOST, IN WHICH COMMUNITIES ARE NOT DIVIDED BY NOISY DANGEROUS ROADWAYS ENABLES US TO USE LESS ENERGY, PRESERVE OUR MOBILITY AND OUR ENVIRONMENT.

INFRASTRUCTURE INVESTMENT

WITHIN THE FEDERAL BUDGET ALL SPENDING IS CONSTRAINED. THE NATIONAL COUNCIL ON PUBLIC WORKS IMPROVEMENT RECOMMENDS THAT FEDERAL SPENDING ON INFRASTRUCTURE FACILITIES BE BOOSTED TO $100 BILLION PER YEAR.

DAVID ASCHAUER, SENIOR ECONOMIST, FEDERAL RESERVE BANK OF CHICAGO, CONTENDS THAT PRODUCTIVITY GROWTH IN THE UNITED STATES HAS DROPPED TO 0.7 PERCENT COMPARED TO 2.9 PERCENT IN WEST GERMANY AND 3.1 PERCENT IN JAPAN. HE FURTHER ARGUES THAT THIS PRODUCTIVITY DECLINE IS RELATED TO THE DECREASED RATE OF ACCUMULATION OF PUBLIC CAPITAL. ASCHAUER QUANTIFIES THE EXTENT TO WHICH UNDER-INVESTMENT HAS CAUSED THE PRODUCTIVITY SLOW DOWN. SIXTY PERCENT OF THE PRODUCTIVITY SLUMP MAY BE ATTRIBUTED TO NEGLECT OF OUR CORE INFRASTRUCTURE.

THE IMPACT OF FEDERAL INVESTMENTS IN OUR HIGHWAYS AND TRANSIT FACILITIES HAVE INDEED SHAPED THE ECONOMIC COURSE OF OUR NATION. IT IS DIFFICULT FOR US TO GET SCHOOL CHILDREN TO IMAGINE AN AMERICA BEFORE FREEWAYS.

FOR THE FUTURE

MISTER CHAIRMAN, MEMBERS OF THE COMMITTEE, WE IMPLORE YOU:

- ESTABLISH A STRONG MULTIMODAL EMPHASIS IN PLANNING, FUNDING, AND DECISION MAKING.
- RECOGNIZE THE ECONOMIC IMPACT OF REDUCED AIR QUALITY THROUGH A TAX ON POLLUTION.
- SUBSTANTIALLY INCREASE THE FEDERAL INVESTMENT IN OUR NATION'S SURFACE MOBILITY. IN THE URBAN AND SUBURBAN REGIONS THIS INVESTMENT MUST INCLUDE BALANCED DEVELOPMENT OF NEW HIGHWAYS, RAIL TRANSIT, TRANSITWAYS, BUSES, AND OTHER HIGH OCCUPANCY VEHICLE STRATEGIES; INTEGRATION OF "SMART ROADWAY" SOLUTIONS TO

MAXIMIZE THE MOVEMENT OF PERSONS RATHER THAN VEHICLES; AND BALANCED DEVELOPMENT OF OUR COMMUNITIES SUCH THAT HOMES AND JOBS ARE NEAR ONE ANOTHER, PEDESTRIANS ARE NOT SECOND PRIORITY, AND CLUSTERS OF DEVELOPMENT BRING FUNCTIONS CLOSER TOGETHER.

- INCREASE THE EMPHASIS ON FORMULA FUNDING VIS-A-VIS DISCRETIONARY FUNDING.
- ELIMINATE THE PERENNIAL DISPARITY IN IRS TREATMENT OF EMPLOYER PROVIDED FRINGE BENEFITS. TAX PARKING OFFERED BY AN EMPLOYER.
- REQUIRE CLOSER INTEGRATION OF TRANSPORTATION INVESTMENTS AND LAND USE DECISIONS.

FOR THE NEXT THREE YEARS, THE RULES OF THE BUDGET BATTLES HAVE CHANGED. MODERATE INCREASES IN FEDERAL FUNDING ARE POSSIBLE AND PROBABLE DUE TO THE BUDGET ENFORCEMENT ACT OF 1990. LIFTING THE SUBCATEGORY LIMITATIONS ALLOW MORE FLEXIBILITY THAN WE HAVE WITNESSED IN THE PAST FIVE YEARS.

BUT THE BROADER ANALYSIS IS THE DIRECTION OF OUR NATION'S INFRASTRUCTURE FOR THE NEXT SEVERAL DECADES. YOUR DECISIONS WILL SHAPE THAT INVESTMENT. AND THAT INVESTMENT WILL SHAPE OUR NATION.

THANK YOU.

Testimony
Robert C.H. Mathews,
Chairman, Long Range Planning Committee
Board of Commissioners of the
Metropolitan Nashville Airport Authority

Before

The Public Works and Transportation Committee
United States House of Representatives
Nashville, Tennessee
2:00 P.M., Friday, December 7
Legislative Plaza, Rooms 12 and 14

Mr. Mathews:

Thank you Mr. Chairman.

My name is Robert Mathews. I am the chairman of the Long Range Planning Committee of the Metropolitan Airport Authority. The Authority operates Nashville International Airport and General Aviation and Reliever Airports in the Middle Tennessee area.

With me today is General William G. Moore, President of the Authority. Following my remarks, General Moore and I will be pleased to answer any specific questions you may have.

I want to express the sincere gratitude of the people of the Middle Tennessee region for the outstanding work of this committee. You have enabled us to establish improved air transportation services for personal and business travelers, and for the shipment of cargo.

Most particularly this community recognizes the leadership role of our Congressman, Bob Clement. We are grateful to him.

The capacity of our nation's airports is today a major domestic and international issue. The facilities at airports in major markets such as New York, Chicago, Atlanta, and Dallas are presently operating at capacity. This requires that regional hubs respond to national demand. This increased use, in turn, demands that regional airports build additional infrastructure. Thus, the funding for infrastructure projects at regional airports is an urgent and pressing need.

The Metropolitan Nashville Airport Authority recently submitted to the Federal Aviation Administration (FAA) a detailed request for an FAA Letter of Intent for approximately $180 million to be used for infrastructure, for noise mitigation, and for other FAA approved projects at Nashville International Airport. Importantly, these projects received almost unanimous approval by local legislative and regulatory agencies, prior to being submitted to the FAA. When completed, this new infrastructure will permit the expansion of American Eagle commuter services to communities in our region and the expansion of the

American Airlines Hub, at Nashville. This expansion will provide needed access to additional markets in every region of the United States.

We submit to you today that the needs of Nashville are essentially the same as the needs of other regional hubs, and I urge you through this committee to do everything possible to assist the FAA in meeting these needs. Ours is a national system of aviation, and delays at one airport as a result of capacity problems have an impact on other airports in our nation.

The issue of aircraft noise over neighborhoods that surround airports is very important to the development of air transportation infrastructure and services throughout the United States. Cities like Nashville are responding to neighborhood concerns about noise with the aid of FAA funding. This work by local communities is to be commended. There is, however, a developing inconsistent pattern of local regulations throughout the nation. This lack of consistency threatens the efficiency and limits the potential of our domestic and international air transportation system. In previous testimony before Congress, General William G. Moore spoke for the Nashville Airport Authority in urging a National Noise Policy which offers fair and equitable solutions to homeowners concerns about noise. This policy should emphasize the speedy implementation of stage 3 aircraft which operate more quietly and efficiently.

Today I would like to re-emphasize the need for National Noise Policy. Failure to implement such a policy will have serious long-term impact on the ability of our national and international air transportation system to function as it should.

My third point today is to urge this committee to take an activist role in supporting the establishment of international gateways at regional hubs like Nashville. This city recently completed a study to determine its capability to compete for international routes. The study concluded that Nashville is in a favorable position in the international arena. We have a centralized geographic location, service by the American Airlines hub and by other major carriers, and numerous economic and cultural attributes. Our capabilities include the potential for expanded freight services supported by our existing ground, water and rail transportation network.

The addition of international passengers who travel for personal, business and tourism offers significant economic incentive for Nashville International Airport and the region it serves. The ability of this community to attract international service is, however, seriously inhibited by existing bi-lateral agreements that govern international air transportation. This is also the case for every community seeking international service.

In January of 1990, the Federal Department of Transportation took a major step to permit greater access to regional markets by domestic and international air carriers. It is now apparent that recent developments in the political, economic and cultural structures of the world, particularly in Western and Eastern Europe, will have long-term implications for air transportation between nations. This emphasizes the need for Congress to urge the Department of Transportation and the Department of State to take major steps during the coming months to accelerate the granting of routes between foreign markets and domestic regional gateways.

All of this is to suggest that our national and international air transportation system is vital to this nation's economic and cultural well being. Additionally, we at the Airport Authority are very aware that air transportation does not operate in a vacuum. Air transportation, in fact, relies upon other modes of transportation within our region. Our goal is that of a fully integrated, comprehensive, state-of-the-art intermodel transportation system. The quality and capability of other modes of transportation are directly related to the ability of air transportation to function. Let me site two examples. First, our recent International Air Transportation Study clearly points out that Nashville's central geographic location makes it very attractive for passengers and for freight.

Passengers travel to Nashville and then to other points for the purposes of business and tourism. Secondly, freight can be shipped into Nashville and distributed to other areas of our region by rail, water and air. The addition of international travel simply increases the importance of other modes of transportation.

Recognizing the important mission of this committee in Congress, I would be remiss if I did not emphasize that attention to all modes of transportation is vital to our region. It is of great concern to this community that well documented problems with roads, rivers, bridges, airports, seaports and sewer systems have been found by your Committee. We urge that the concepts and funding necessary to achieve superior status in all modes of transportation should become a national priority. In addition to the basic needs for improved and new infrastructure, let me also suggest that regions like Nashville would benefit from futuristic thinking that incorporates rail access to and from communities surrounding urban cores. It is also my belief that we as a nation should allocate additional federal funds for legitimate research in the critical area of transportation by our nation's universities and colleges. It is now apparent that Nashville and its sister cities throughout the nation have unique opportunities to participate more fully in the full range of opportunities available through expanded domestic and international business and cultural activities. The extent of those opportunities is directly related to our government's commitment to air, ground and water transportation.

In closing, let me thank you again for coming to Nashville to hold these important hearings. We in this city have been the beneficiaries of your good work in the past, and you can expect our full support and confidence as you move forward in the future.

And now General Moore and I will be glad to answer any questions you may have.

REMARKS OF EMERSON MEGGS

ROBERTSON COUNTY EXECUTIVE AND PRESIDENT

GREATER NASHVILLE REGIONAL COUNCIL

I am Emerson Meggs, County Executive of Robertson County. I speak to you today in my role as President of the Greater Nashville Regional Council, a regional planning and economic development agency serving 13 counties and 50 cities in Middle Tennessee. Our Region has approximately 1.1 million people living in urban, suburban and rural communities.

Every few years the Council assesses the infrastructure needs of the Region as part of our overall economic development and regional planning. This year we updated this Regional Capital Improvements Plan. Local officials and citizens in each county met with the Council staff to identify the capital improvements needed in that county for the next five years. Those attending the meetings were people who would have the closest understanding of the needs, including county executives like myself, mayors, planners, road superintendents, public works directors, chamber of commerce leaders, and, of course, private citizens.

We looked at needs in seven different areas: housing, industrial sites, recreation, transportation, solid waste, water and sewer, and other facilities in support of economic development. The projects were almost all regional, meaning that they impacted two or more jurisdictions.

When we finished, we had amassed a list of over 800 different projects with a combined cost estimated to be nearly $4 billion dollars. Of those, transportation headed the list with 241 projects costing a total of $2.7 billion. Almost half of those projects, $1.2 billion, improve existing roads and bridges. Water and sewer was the next largest category, with over $500 million in improvements needed. Solid waste projects will cost another $95 million, almost three times what was needed four years ago, when we last inventoried the need.

This study documents the need for improvements in our infrastructure. Our region has experienced strong growth, especially in suburban areas. We have strained to keep up with that growth and the demands of the public. We have far more needs than resources to meet those needs.

These problems aren't just limited to Nashville and the suburban communities. Many of our rural counties also face roads that limit economic growth, water and sewer systems that serve too few and pollute too much, and new solid waste disposal requirements that cost far more. We need help to tackle these and other infrastructure needs that tax our all already over-burdened resources.

The Council is also involved in efforts to improve other forms of transportation. When one of the major railroads in this area abandoned parts of its branch lines to the outlying counties of Nashville, local governments stepped in to form short line railroads. The Cheatham County Rail Authority and the Nashville and Eastern Rail Authority have taken over rail lines that were allowed to deteriorate for years and are struggling to rehabilitate them. Their work is slow. The Federal Railroad Administration and the Tennessee Department of Transportation have assisted these groups, but a lot of work remains. These rail lines are vital lifelines to many companies and, consequently, to the communities. They haul raw materials and finished products today, but may someday carry commuters as well.

To solve some long-term traffic problems, we are planning to implement mass transit for the region. Studies warn that we cannot build enough roads to meet our needs. Our land is too valuable, our environment too important, our national interest in oil too vital to continue to depend on the automobile as our first means of transportation. We have established a regional transportation authority that will examine expanding the bus service from Davidson County into the surrounding counties, as well as making long-range plans for light rail service.

The bottom line, as always, is money. We have relied over the decades on the federal government to provide a substantial portion of the cost of major new roads. We now are bearing a greater portion at the state and local level. We still need the federal government to help fund those projects.

We are continually examining ways to get more use out of existing resources. We operated a demonstration regional ridesharing program for several years until a private company took it over. We were instrumental in setting up the southeast's first transportation management association in Brentwood, designed to use many strategies to reduce congestion in a suburban city.

Even with innovative programs, we still need those federal dollars. Each program I've mentioned today had federal transportation dollars as part of its seed funding.

We are planning for our future. We cannot and must not be short-sighted. As we strive to serve our citizens, we need the federal government as a strong partner in our efforts.

2354

REGIONAL CAPITAL IMPROVEMENTS BUDGET
OVERALL ECONOMIC DEVELOPMENT PROGRAM

FOR THE
GREATER NASHVILLE REGION OF
TENNESSEE

GNRC
GREATER NASHVILLE
REGIONAL COUNCIL

SEPTEMBER, 1990

What is the
GREATER NASHVILLE REGIONAL COUNCIL?

The Greater Nashville Regional Council, or GNRC, is a regional planning and economic development agency serving the 13 counties and 50 cities of upper Middle Tennessee. Created in the late 1960s as the Mid-Cumberland Council of Governments and Development District, the Council has evolved into a strong forum for local officials to plan for the future of the Region.

All of the Region's mayors and county executives govern GNRC through their membership on the Council. Other Council members include a state senator, a state representative and representatives of industry and minorities. Day-to-day activities are directed by a smaller executive committee. Staff members work closely with local officials in the Region, as well as state and federal agencies and officials.

GNRC plans for the continued orderly development of the Region through strong intergovernmental coordination and cooperation. Such efforts seek to avoid costly duplication of programs and facilities, to increase efficiency and effectiveness and to enhance the quality of life. The Council helps local governments implement those plans by identifying funding sources, applying for grants, developing public-private partnerships, and examining cooperative ventures.

EXECUTIVE SUMMARY

Local governments have long used capital improvements programming as a tool to link long-range planning with the budgeting of major construction projects designed to achieve their planning goals. The capital improvements plan compiles the community's major physical development needs, indicating each project's location, estimated cost, source of funding and schedule. The Regional Capital Improvements Program (RCIP) is similar in many ways to the local effort.

This document is organized around seven functional types of regional infrastructure projects: transportation, housing, recreational facilities, industrial site development, solid waste, water and wastewater systems, and other facilities supporting economic development. The lists cover capital improvement needs for the period FY 1991 through 1995.

The report focuses on regional impact projects affecting two or more jurisdictions that are necessary to support long-term economic development of the region. Some local projects are included because they were deemed necessary to support overall economic development.

Each project is noted by the year scheduled for funding. That schedule reflects, but does not completely indicate its relative need in that community. In the past, the Council ranked projects by priority within each functional area. That is no longer done because there are actually many priority projects in each category. Funding for those can often be pursued simultaneously. However, the Council may chose to determine the ten to fifteen highest priority regional projects in the future to help expedite them.

According to this study, the Greater Nashville Region will need $3,961,970,790 in improved infrastructure between 1991 and 1995. The table below shows the total broken down by the seven areas.

TOTALS BY TYPE OF PROJECT

Project	Total Costs By Project
Housing	$30,536,900
Industrial Sites	$74,590,440
Other Facilities	$439,861,750
Recreation	$103,037,500
Solid Waste	$95,900,000
Transportation	$2,729,835,560
Water and Sewer	$506,508,640
TOTAL	$3,980,270,790

A breakdown by county follows:

TOTAL COSTS BY COUNTY

COUNTY	TOTAL COSTS BY COUNTY
Cheatham	$34,553,400
Davidson	$905,831,000
Dickson	$383,227,000
Houston	$84,250,000
Humphreys	$263,565,200
Montgomery	$292,177,630
Robertson	$321,125,440
Rutherford	$368,284,800
Stewart	$149,164,000
Sumner	$311,897,660
Trousdale	$16,563,560
Williamson	$367,056,100
Wilson	$491,575,000
TOTAL	$3,989,270,790

Some projects listed in this report are primarily serve a local community; others serve more than one jurisdiction and are regional. The final table breaks down the total costs between the local and regional projects.

TOTAL COSTS BY TYPE OF PROJECT

PROJECT TYPE	TOTAL COSTS BY TYPE
Local	$49,501,020
Regional	$3,939,769,770
TOTAL	$3,989,270,790

PREFACE

Regional councils, such as the Greater Nashville Regional Council were not established to be operational levels of government. Rather, their purpose is to assist local government officials in developing programs to deal with problems which cross local boundaries and to recognize regional needs and priorities in their own local efforts. In working to achieve this purpose, and to meet the requirements of many federal area-wide programs, regional councils adopt long-range plans and programs at the regional level.

The Regional Capital Improvements Program is one mechanism for carrying out the goals and objectives of the long range plan. The Council prepared this document as a means of increasing the effectiveness of the regional planning program. The Regional Capital Improvements Program (RCIP) provides the plan necessary to translate long-range (twenty-year) regional plans into five-year programs for local government implementation.

Capital improvements programs are also effective tools for encouraging economic development. This study identifies key infrastructure needs for each county to enable it to accomplish its overall economic goals.

ECONOMIC DEVELOPMENT GOAL

Achieve a viable, well-balanced economy throughout the region using available natural and human resources to their fullest potential and in the most efficient and effective manner.

Objective:
To increase the number of varied job opportunities throughout the region particularly in areas of high unemployment and/or low income.

Policies:

- new industrial/commercial sites are to be located near appropriate employee markets.
- public capital improvements beneficial to new industrial/commercial facilities are to be emphasized in areas of high unemployment and/or low income.

Objective:
To increase economic diversification in the region by attracting new types of job opportunities.

Policies:

- job training opportunities will be increased to provide a more diverse skilled employee pool.
- part-time job opportunities for senior citizens will be encouraged through active community recruitment and grant applications.
- active industry recruitment will center on bringing new types of businesses into the region.

Objective:
To increase and promote the recreation-tourism industry within the region.

Policies:

- public improvements supporting existing recreational-tourism areas or necessary for the development of new areas will be given priority consideration for funding.

--- from the *Mid-Cumberland Region Goals and Objectives 1980*.

ECONOMIC DEVELOPMENT PROGRAMS

Introduction

The Greater Nashville area has historically had a strong economic base. The mid-1980s saw development surge on the basis of significant achievements here: American Airlines' selection of Nashville as a hub and Nissan's and General Motors' decisions to build new automobile plants in Middle Tennessee.

By the end of the 1980s, the regional economy was slowing down, led by declines in real estate. Changes in the federal tax laws and overbuilding helped slow the economic engine. The *Wall Street Journal* recently described what happened in Nashville as a microcosm of the economic problems facing the United States in the 1980s.

Whatever happens in the national economy will affect Middle Tennessee. While the Region's economic diversity helps avoid the wide swings of many other regions, this area still reflects the overall national trends. Some forecasters predict a short recession; that would certainly not help the Region's recovery. However, the underlying base is strong enough to weather such downturns and recover. In the meantime, most local governments are mounting aggressive economic development programs.

Each county executive and mayor in the Region recognizes that a community will not attract and develop jobs for its people without the infrastructure to meet the needs of industry. Each also realizes that such resources alone are not enough to ensure economic growth. In every county, local leaders are pursuing ways to interest new companies to move to their community, encourage existing industries to expand, and help entrepreneurs develop new businesses locally.

The following discussion highlights some of the many efforts underway to enhance local economies. More and more, communities are cooperating regionally on programs and resources, an approach that will improve every community's opportunities.

Regional Issues and Activities

Partnership 2000

Historically, economic developers in the Nashville and other counties in Middle Tennessee have worked closely together in a symbiotic relationship. Nashville had the name and the urban resources needed to attract companies. The other counties had land, water, and labor to satisfy plants looking to be near a city. All benefited from a good relationship built over many years.

By 1988, the regional economy had begun to slow from the heady days of the mid-1980s. That year, leaders in the Nashville Area Chamber of

Commerce decided to push harder for economic growth. The business community set out on an aggressive plan to stimulate economic activity, called Partnership 2000.

Partnership 2000 is a four-year, $6 million regional economic development program sponsored by the Nashville Area Chamber of Commerce and funded by hundreds of Middle Tennessee businesses. The program works to build coalitions for growth among business, government and community leaders all over Middle Tennessee.

Partnership 2000 has included economic development leadership from throughout the Greater Nashville, South Central Tennessee and the Upper Cumberland Regions. These regional leaders serve on several committees, encouraging Partnership to keep a broad regional perspective.

Partnership 2000 is developing a strategic plan to retain and expand existing businesses and employment, attract new investments, and work to improve the quality of life in the region. Three measurable goals exist:

1. To assist in generating 40,000 new jobs.
2. To increase the market for goods and services by $1.7 billion.
3. To record $4 billion in combined residential and non-residential construction.

Through Partnership 2000, the Nashville Chamber is strengthening its programs for recruiting new companies and helping existing businesses, especially small businesses. They will market the region in a new advertising campaign.

Partnership 2000 is developing a strategic plan for economic growth. Besides its strong emphasis on existing industry and small business, the plan will focus on attracting specific industries. They have not completed the plan, but have already announced that aviation-related companies are first on the list of targeted industries.

Each county in the Region is actively involved in Partnership 2000. Each also has specific local programs focused on the needs of their county.

Economic Development Initiative

South Central Bell and the State Department of Economic and Community Development are jointly funding a study of existing industry in Tennessee. Beginning in 1989 with a pilot program in Rutherford county, the study expanded into 15 counties in 1990, including three more in the Greater Nashville Region: Montgomery, Williamson and Wilson. Plans call for expansion to 25 counties in 1991.

South Central Bell and the state work closely with the county, cities, and the chamber to get accurate information about the business climate in each county. They interview existing manufacturers to determine the strengths and weakness of the climate as the businesses perceive it. They will ask about business needs and the labor force. The data are analyzed at Middle Tennessee State University and presented to the county.

Not only will this study give each county better data about its local economy, it will help to build a better relationship between business and government. The study should be a strong foundation for future economic development activities.

Environmental Constraints

The Greater Nashville Region faces serious environmental constraints that will affect economic development in the Region. The constraints should not prohibit industrial growth, but they will force some expensive remedies.

Air Quality. Since 1977, the U.S. Environmental Protection Agency has determined that Davidson, Rutherford, Sumner, Williamson, and Wilson Counties do not meet the standards for clean air. These counties did not attain the requirements for ozone, so they were designated "non-attainment areas." EPA placed certain requirements on Davidson County to attempt to clean up the air. Those requirements included auto emissions testing and industrial offsets. The other four counties were not included in these requirements until this year, when EPA and the State Air Pollution Control Board agreed that they should have been under them all along.

EPA's requirements affect industrial development in several ways. Industries which produce volatile organic compounds (VOCs) that help to produce ozone are the most affected. Those industries include: printing, painting operations, fiberglass construction, bakeries, and dry cleaners. Large plants seeking to locate or expand in a "non-attainment area" must show that they are reducing the overall amount of VOCs in the air. Affected industries seeking to expand must significantly clean existing emissions. New industries in these categories must look for places where existing plants no longer operate or purchase the rights to benefits of reduced emissions from another plant in the area.

Many affected industries, recognizing the difficulty of complying with EPA's guidelines, simply located or moved to expanded quarters outside of Davidson County. With the requirements now extended to the four adjacent counties, affected industries will likely move to the next tier counties or elsewhere in the Region.

EPA and the State are currently considering including the remaining three counties of the Nashville MSA in the "non-attainment" area. If so, these industrial offset requirements will apply to Cheatham, Dickson, and Robertson Counties as well.

Wastewater. The Commissioner of the State Department of Health and Environment has recently approved a plan to solve the problem of chronic sewer overflows in Metro Nashville. Until the Commissioner was satisfied with Metro's plan, he prohibited almost all new development in the area they serve. Because Metro treats sewage from many surrounding communities, the order also stopped development in Hendersonville, Goodlettsville, La Vergne, Mt. Juliet, northern Williamson County, the Harpeth Valley Utility District (parts of Davidson, Williamson and Cheatham Counties) and the Cumberland Utility District (northwest Wilson County).

Metro's proposals would cost over $600 million to solve the problems. At this time, Metro is examining ways to pay for the improvements over several years. The other cities and utility districts involved face similar problems, but couldn't resolve theirs until the Commissioner approved Metro's plan.

Other constraints. Two other environmental issues may hinder future growth: solid waste and water supply. Problems with both stem from increased demand outstripping supply and increased environmental awareness.

Local governments in this Region are running out of landfill space and must bring all existing landfills up to stricter state standards in three years. New landfills must have mechanisms to protect the environment. At best, these new measures will be extremely expensive; at worst, local governments may not be able to locate a landfill in their jurisdiction. Areas unable to deal safely with solid waste will have a difficult time attracting industrial growth.

Several Greater Nashville communities face water shortages. The drought of the mid-1980s proved how water scarcity can affect some of the fastest growing areas in the Region. Many cities, counties and utility districts are examining ways to link their water supplies to reinforce each other in the future. Some are seeking new pipelines to the Cumberland River to provide a constant source.

County Strategies

CHEATHAM COUNTY

Cheatham County has experienced significant residential growth and has continued to have several strong industries. However, the service sector has not kept up with the other growth. Each of the cities needs additional commercial and office development. Kingston Springs, with its access to I-40, is particularly interested in office and commercial growth.

Ashland City's industrial park will need to connect to the City's sewer plant to expand. In the southern part of the County, limited capacity and weak water pressure are hindering further growth. Some have recommended creating a county water authority, as well as connecting Kingston Springs and Pegram to Metro Nashville or Harpeth Valley U.D. water systems.

Another industrial park may be possible in the Pleasant View area near I-24. Utilities are not now present on that 100-acre site. Pegram has a small 1 to 2-acre site near the railroad that could be developed industrially.

DAVIDSON COUNTY

Although Partnership 2000 is the largest economic development thrust in Davidson County, other activities are underway.

The Nashville International Airport is one of the strongest new assets for the Region. The airport authority has announced plans for a new 8,000-foot runway. American Airlines recently announced that its hub here would become an omni-directional hub, rather than just a north-south hub as was originally planned. They announced additional non-stop flights. The Nashville hub has grown faster than they expected, but that growth has been curtailed recently by a lack of airplanes. Additional international flights may come as foreign countries allow more entry.

Metro Nashville created a new Office of Economic Development in 1988, the first such office in its history. Their first goals are to simplify the requirements on new businesses. They hope to eventually approach "one stop shopping" for all required permits, licenses, and approvals. They work with new businesses coming into the city.

The Nashville Business Incubation Center is expanding with a second floor to accommodate more than a dozen companies seeking to move there. The Center hopes to have satellite centers within the next five years.

The Middle Tennessee Industrial Development Association is a regional economic development organization funded by the electrical cooperatives and TVA. They maintain information on industrial sites and work closely with prospective industries. Other utilities, including South Central Bell, Nashville Gas, and the CSX Railroad, maintain industrial development staffs who work in all areas of the Region.

Davidson County continues to be the retail center of the Region. The Goodlettsville/Rivergate area has over four million square feet of retail space, making it the largest concentration of such space in the state. A new mall opened in August in Bellevue, joining the other regional malls in the Antioch area(Hickory Hollow), Green Hills, and downtown (Church Street Centre).

Within the City of Goodlettsville, three new office buildings and a new restaurant are under construction. Recently, mixed-use planned unit development incorporating over one half million square feet of space received preliminary approval. The Goodlettsville Area Chamber of Commerce actively assists and informs both new and existing businesses. Their information brochure and video won first place awards at the annual Governor's Conference on Economic and Community Development competition.

Tourism is a major industry in Davidson County. In 1988, the last year for which information is available, tourism brought in over $1.6 billion dollars and employed over 33,000 people. Davidson County's tourism industry generates about one-third of the total state tourism dollars. Davidson County is a destination location, so the entire region benefits from the traffic.

Both the Nashville Area Chamber of Commerce and the Goodlettsville Area Chamber of Commerce promote tourism heavily. In 1990, the Nashville Convention and Visitors Bureau in the Chamber spent $8 million in private and public contributions to promote Nashville to tourists. The Goodlettsville Chamber promotes historic sites and shopping in the Goodlettsville/Rivergate area.

Nashville has also become a major convention center. Nashville has two large convention centers. One at the Opryland Hotel has 145,000 square feet of exhibit space and some 5,000 committable rooms nearby. The Nashville Convention Center downtown has 119,000 square feet of space and over 4,000 rooms nearby. The American Airlines hub has enhanced Nashville as a center for medium to large conventions.

DICKSON COUNTY

Dickson County works closely with the state and the Nashville Chamber recruiters and with MTIDA. They advertise in national site location magazines and make two out of state sales trips annually. Staff attempt to call at least twenty out-of-state industries each month to update Chamber files on potential expansions, locations, etc. They also mail information directly to industries.

To identify the needs of existing industries, the chamber meets every other month at a local plant. The mayor and county executive attend and discuss the industry's needs and plans.

The Chamber encourages retail and small business growth by sponsoring "Business After Hours," special seminars, and working with the Distributive

Education Clubs in the high school. They encourage local shopping through messages on telephone and electricity bills.

Local banks have joined to form a loan pool for capital investments in businesses. That pool maintains a desirable interest rate. The Chamber also helps inform businesses about small business financing tools.

Agriculture is an important industry in Dickson County. Each year the Chamber sponsors a farm tour with a presentation on agriculture. They recognize small agribusinesses at the annual Farm/City Awards Dinner. Dickson County has a large auction barn which attracts thousands monthly to agricultural auctions.

The Chamber has a Film Commission. They've photographed sites suggested by the State Film, Music, and Entertainment Commission which might be suitable for location filming. The photographs are on file at the state and local people are briefed on finding the sites on short notice.

HOUSTON COUNTY

The speculative building in the Houston-Stewart County Industrial Park is under a lease purchase arrangement with the industrial tenant. That building increased the number of prospective industries interested in the park by 80 to 90 percent. For that reason, both counties plan to reinvest the proceeds into a new speculative building.

The industrial park still needs a gas line, but they feel certain they could get the line when an industrial prospect appears that needs it.

Houston and Stewart Counties are also considering linking their water lines to provide back up service. This would provide a better guarantee to industry in either county.

A private developer is constructing a new office building in Erin because of limited available office space.

HUMPHREYS COUNTY

In many ways, Humphreys County is still recovering from the loss of hundreds of jobs in major plant closing in the early 1980s. Consequently, they are committed to diversifying their economy.

They are working with large industries, but are more interested in small employers. Their goal is to have several companies which employ 50-100 people. They are looking at tourism to help broaden their base.

Located along the Tennessee River and Kentucky Lake and home for one of country music's most popular entertainers, Loretta Lynn, the county already has a strong tourism draw. However, local leaders are working on projects to increase that pull.

For several years, they have worked with the Tennessee Department of Conservation and the General Assembly to up-grade Johnsonville State Historic Area into a broader state park with a marina and campgrounds. They also need the road leading to the park improved.

Waverly leaders are looking at developing the city into an outlet retail center, similar to Boaz, Alabama. They feel that they could capture tourists traveling I-40 and could become a destination for some of the same groups who travel regularly to Boaz.

MONTGOMERY COUNTY

The Clarksville/Montgomery County Industrial Development Board works closely with the State and with MTIDA to recruit new industry. The Board plans to target certain industries and a more aggressive marketing program.

Existing industries are visited periodically, but County leaders hope to develop more mechanisms to serve those industries. Montgomery County is involved in the Economic Development Initiative, the survey of existing industries. Local industries are honored at an annual Industry Appreciation Dinner and a golf tournament.

The Chamber has emphasized small businesses for the past two years. They work with SCORE and Austin Peay State University to produce seminars on starting a small business. The Chamber has a local SCORE chapter. Also, a bimonthly publication has an advice column for small business problems.

The Chamber has started a successful "Executive Dialogue" program. Two groups of 10-to-12 business leaders meet monthly with an accountant, a banker, and a lawyer. Deliberately selected from non-competing businesses, the businesspeople share common problems and get free expert advice. A third group will likely begin in January 1991.

Several groups in the County are beginning to look for common marketing themes. The Tourism Commission will reevaluate and upgrade its promotional materials this year. The Chamber, the Industrial Development Board and the Tourism Commission, among others, are comparing notes to see how to strengthen their marketing.

The Chamber will promote shopping in Clarksville in the fall. They are participating with the City and the County in beginning a Main Street program for downtown. In addition, they have joined Keep America Beautiful.

The Tourism Commission has just moved to its own building near the interstate to make it easier for tourists coming into Clarksville. Their staff attend group tours trade shows to encourage motorcoach tour business.

ROBERTSON COUNTY

Robertson County Chamber of Commerce has recently changed executive directors. Consequently, they will be reassessing existing programs and making new plans for the future.

In the past they have sought small-to-medium sized industries that were environmentally clean and compatible with existing companies. Many contacts have come from the state and MTIDA. Robertson County has consistently had low unemployment which has allowed them to focus their recruiting on controlled areas.

RUTHERFORD COUNTY

In December 1989, the Chamber published its first community resource and industrial site guide, patterned after a similar guide Nashville Gas publishes for its service area. It contains in depth community data, marketing information, business costs, and other valuable information for businesses. Realtors provided information on industrial sites. They plan for this to be an annual publication and will provide it to any interested industry or business.

Rutherford County was the pilot county in the Economic Development Initiative, the survey of existing industries. The Chamber has begun a quarterly "President's Council" for the CEOs and presidents of county industries. It helps the Chamber keep in touch with those people and helps them know each other better.

For budding entrepreneurs, the Chamber publishes a "How to Start a Small Business" guide. They have a branch office of SCORE in Murfreesboro. In cooperation with Middle Tennessee State University, they sponsor a five-week series on "How to Start a Small Business" through the University's Continuing Education Program. They also sponsor a seminar with local bankers called "Successful Business Financing: How to get a Bank Loan."

This year the Chamber plans to produce a new four-color brochure for tourism. They advertise in the *Nashville Travel Guide*, *Travel South* magazine, and in brochures in Welcome Centers. They also conducted a mini-familiarization tour for Welcome Center employees.

A relatively new thrust in amateur athletics has become highly successful. MTSU is the site of the TSSAA boys and girls basketball tournaments for at least the next two years. Those tournaments bring hundreds of teenagers, parents, chaperones, coaches, and fans to Murfreesboro each winter. The chamber plans special programs to serve the teams and spectators to ensure these tournaments return each year.

STEWART COUNTY

Stewart County is committed to reinvesting the proceeds from the lease/purchase of the speculative building in the Houston-Stewart Industrial Park in a new spec building.

In addition to the joint activities described under Houston County, Stewart County is interested in increasing its tourism industry. The Chamber and others work with the riverboat The Queen of Clarksville for regular runs down the Cumberland to Dover and back. They are also seeking a developer for a multipurpose recreation complex on Lake Barkley. The U.S. Army Corps of Engineers who control Lake Barkley are marketing the area for development. The Hickman Creek Recreation Area as planned would have a lodge, golf course, marina and other facilities.

SUMNER COUNTY

Sumner County has successfully attracted industry throughout the county, but especially in the Portland area. In Portland, they have a goal of attracting one new industry each year with 150-200 new jobs. This year they will do considerably better, bringing in probably six new plants with 700-800 employees total. They try to diversify their recruitment. For every automotive parts manufacturer, they seek to bring in two non-automotive manufacturers.

Most of the county works closely with the State and Cumberland Electric Cooperative's industrial recruiters. Portland has a nearly full-time recruiter. Gallatin and Hendersonville both have people, in addition to their chamber staffs, who recruit part-time. Sumner County is also a member of the Four Lake Regional Industrial Development Authority.

Gallatin and Hendersonville will soon update their marketing material. Hendersonville is also completing a video for its recruiting program.

Hendersonville will begin a complete inventory of property in the city. Their computerized database will include parcel numbers, owners, land use, and vacancy information which can be used to identify land suitable for development.

Portland will be emphasizing its retail sector in the next few years. They would like to recapture some of the leakage going to Nashville retail by landing a large shopping center.

Many new restaurants have opened in Hendersonville since the residents enacted liquor-by-the-drink in the fall of 1989. Although the Nashville area has a surplus of hotel rooms, a large hotel may be built in the City in the future. A second merchant's association is beginning. The Chamber is working closely with merchants who fear that the new Hendersonville Bypass will cost them business.

Gallatin is in its third year as a Three Star city, showing that it is prepared for economic development. It has a strong Main Street program working to revitalize the downtown. They face a shortage of inexpensive industrial land. They find they lose industry to other locations because the privately held industrial land is costly.

Working as an umbrella organization, the United Chambers of Sumner County run a county-wide leadership program. They will hold their first economic development conference in conjunction with Volunteer State Community College in October.

TROUSDALE COUNTY

Trousdale County is completing its second year as a Three Star Community. The Business and Industry Committee meets quarterly, developing an excellent relationship between the chamber and the companies and among the companies themselves. The Community Livability Committee meets periodically to work on special projects like litter control, the library, and the depot.

Unemployment is low in Trousdale County: so low, some industries are having trouble filling positions. Many feel that part of the problem is lack of available housing. The chamber mailed information to some top developers in Nashville to get them to look at the County for speculative housing. Although nothing firm has come from that to date, some developers did express an interest in looking further.

The Chamber is also interested in furthering and diversifying business development. Several stores have recently opened or remodeled. A key development is a prototype restaurant opened recently by McDonald's Corporation. It is a new venture into smaller markets and specializes in family-style foods.

Trousdale County is a member of the Four Lake Regional Industrial Development Authority created after the closing of the Hartsville Nuclear Plant. The Authority and TVA have established a small business incubator on the site of the plant. One company at the site is ready to "graduate" to a nearby town.

They hope to capitalize on tourism more in the future. Many people pass through on their way to Defeated Creek Campground at Cordell Hull Lake. They hope promotion of the Avery Trace will help bring more tourists into the county. In a recent development, residents will vote in November on permitting horse racing with pari-mutuel gambling.

WILLIAMSON COUNTY

The Williamson County Commission recently created an Economic Development Council, comprised of representatives of local governments and the three chambers. The Commission authorized them to raise funds to hire a full-time economic developer.

Williamson County is one of the participants in the Economic Development Initiative sponsored by South Central Bell and the State. The Williamson County Chamber anticipates tailoring their economic development program by the results of that study.

To promote tourism, local leaders advertise and regularly attend group tours marketplaces. They are actively involved in the Tennessee Natchez Trace Corridor Association and hope to develop a Native American center near the parkway. Plans are underway for additional, more diverse, attractions.

Sports tournaments draw many to the County. Golf tournaments in Franklin and tennis and swimming meets in Brentwood often feature national competition. With the opening of the Williamson County Recreation Center, those events will likely increase.

Brentwood recruits from four specific areas: corporate office relocation, service industries, retail and residential real estate. Most leads come directly to the Brentwood Chamber office or from local referrals.

Because the County has such low unemployment, Brentwood leaders work aggressively with interested companies to show that labor is available nearby. A public/private program, the Brentwood Area Transportation Management Association, works with the Chamber to customize programs to show companies how employees can come in from out of the county.

The Chamber has marketing materials for retail, office, and residential developers and tenants. An Business Development Committee works with interested companies and with county-wide programs.

Fairview is completing its requirements for certification as a Three Star Community under the state program. They are updating their marketing materials and preparing new information on the industrial park. They plan to market their site with the help of MTIDA, the state, and the Nashville Chamber.

WILSON COUNTY

With its serious sewer capacity problems behind it, Wilson County anticipates strong industrial growth. Its location along I-40 and I-840 and near the Nashville International Airport gives Wilson County several advantages.

Wilson County has an economic and community development board comprised of government leaders, chamber officials, and others. One of their goals is to hire a full-time director. They are also participating in the Economic Development Initiative, the survey of existing industries.

The industrial park between I-40 and US 231 and US 70 to Watertown needs some utilities, but they also hope to expand it by another 300 acres. Local developers are willing to build speculative buildings for industry.

In Mt. Juliet, some improvements are needed to the 600-acre industrial park. A new private industrial park may open off I-40 and SR 109. A smaller industrial park in Watertown also needs water and sewer improvements.

Wilson County leaders are also moving into the convention and special events business. At the fairgrounds, they plan to host conventions of recreational vehicle associations, a strong market that is not presently served in Middle Tennessee. They have committments for a 7,500-member convention in 1993. They are also hoping to expand the Agricultural Center ball fields to host large softball tournaments. Eventually they'd like to have a multipurpose center to offer year-round facilities.

REGIONAL CAPITAL IMPROVEMENTS PROGRAM

Methodology

Since 1977, the Greater Nashville Regional Council has periodically identified the infrastructure needs of the Region as a part of developing the regional economic development plan. The process involves several separate reviews by the local governments and by the Council staff. The following is a brief discussion of each step in the process.

Review of Regional Goals, Objectives, and Plans

The long-range goals, objectives and plans established and adopted by the Council form the basis for the RCIP, since its primary purpose is their implementation. Staff review them to provide the framework to evaluate individual projects. Among the documents used are the *Regional Development Strategy: 1976-2000*, the *Regional Goals and Objectives*, and the 1986 *Regional Infrastructure Assessment and Capital Improvements Program*.

The Project Inventory

The county executive, mayors, chamber of commerce officials, planners, public works officials, highway commissioners, and other local leaders received copies of the 1986 RCIP for their review early in the process. Staff asked them to consider what had been accomplished and what needed to be added to the list of projects.

In all but two counties, the county executive convened a public meeting and invited all mayors and other local leaders to discuss county economic development. Davidson and Montgomery Counties had each held extensive public hearings in the process of developing their county capital improvements budgets. In those counties, staff met with local planners and others to determine which were regional projects.

The public meetings phase took approximately three months. Following each meeting, staff contacted other officials and researched costs to identify additional projects, estimate costs, and determine schedules. In many cases, staff calculated estimated costs based on average costs per unit.

Determination of Regional Projects

Each project submitted by a local government may not have an impact upon the surrounding communities or upon the overall development of the Greater Nashville Region. Staff used the following definitions to determine if a project should be classified as a regional capital improvement:

> To be a capital improvement project, it must be a major public project involving the acquisition, construction, renovation or modification of any land, public building, public utility, public

thoroughfare or place of public activity which has a useful life expectancy of ten years or greater or has a total cost exceeding twenty thousand dollars ($20,000). The acquisition of land (excluding utility easements) for capital improvements shall constitute a project regardless of cost.

To have regional impact, a project have an effect on two or more local government jurisdictions or be located in the central business district of Metropolitan Nashville Davidson County or Clarksville, because of the economic impact of those areas on the Region.

Many projects which were determined to have only a local impact were included in the analysis because of their importance in support of overall economic development. Including both regional and local projects within the RCIP provides a truer picture of the infrastructure needs of the region.

The Council staff completed the initial analysis. Results were sent to local officials for their review and correction.

Board Action

Council board members received a second draft of the report at the Council's annual meeting on September 27, 1990. They reviewed and adopted this report at that meeting, pending minor corrections.

This 1990 update reflects the Region's infrastructure needs and goals. With planning, budgeting, and cooperation among governments, these projects can become a reality for the benefit of the people of the Region. This is a working document, scheduled for regular updates to ensure that it accurately reflects the plans of the Region.

Benefits of the Regional Capital Improvements Program

The principal benefits and advantages derived from developing the Regional Capital Improvements Program are:

1) The RCIP allows local officials to see in an organized fashion the projects their own and neighboring communities have proposed.

2) The RCIP illustrates where and how local projects fit into the larger regional setting.

3) Elected official and citizens gain a better insight into where tax dollars are being spent, as well as information on proposed capital expenditures in neighboring communities that could affect their own.

4) The RCIP increases the possibility of joint projects between local governments and identifies potential cost savings.

5) Local communities can better plan their growth and development instead of following a pattern of reacting to crisis, making decisions piecemeal, or having decisions made by some other agency.

6) The RCIP increase local government input into the State budget process, thereby increasing the potential for receiving additional funding from state agencies. The RCIP presents the Governor's Office and the State Legislature with a joint expression of regional development needs and priorities of the counties and cities of the Greater Nashville Region.

   Additionally, such a joint expression of project needs and priorities should favorably influence the funding decisions of federal agencies in assisting local governments better meet their regional development objectives.

7) The RCIP document becomes a coordinated regional investment plan for local governments and a framework for private economic planning and investment in the Region.

8) The RCIP also provides a more complete base from which the Greater Nashville Regional Council can assist project coordination, and review state and federally assisted projects as required by the state and local project review process.

TESTIMONY BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
NASHVILLE, TENNESSEE
DECEMBER 7, 1990

BY BRADFORD MILLER
EXECUTIVE VICE PRESIDENT
TENNESSEE ROAD BUILDERS ASSOCIATION

ıod afternoon, Mr. Chairman, Representative Clement and members of the committee. I am Brad Miller, executive vice president of the Tennessee Road Builders Asssociation which is located here in Nashville. I am pleased to present testimony today before the House Committee on Public Works and Transportation on the status of this country's infrastructure and particularly its transportation system.

I am here on behalf of the members of the Tennessee Road Builders Association and its national affilitate, the American Road and Transportation Builders Association, to lay before the committee the problems with our transportation infrastructure and what it will mean if, as a nation, we fail to correct the deterioration in our highway, bridges and streets.

We know a problem exists. The Federal Highway Administration in its 1989 Conditions and Performance Report to Congress stated that a Federal-aid Highway program of $40 billion per year was necessary to correct the deterioration of our highways. In its survey of priority issues, the National Conference of State Legislatures ranks road and highway construction and improvement as the third issue behind tourism and agricultural environment - neither of which can prosper and grow without a sound transportation sysytem.

At the outset, I will say that we believe that the financial decisions that the U.S. Congress makes next year in the transportation area will have a direct impact on the nation's economy and well-being long into the future. But first we must ensure that the federal highway user fees are not raised for non-transportation purposes, including to help balance the federal budget. The Highway Trust Fund along with the federal gasoline and diesel excise tax was established to SOLELY fund the construction and repair of our highway and bridge system. Diverting these funds would severely impact the ability of federal and state governments to meet identified infrastructure needs.

America is built on mobility. Its vast size places a high value on the ability to move people and goods over both short and long distances in an economical and efficient manner. The American highway system, developed jointly by the federal and state governments, has had more to do with our quality of life and economic prosperity than any other single factor.

The efficiency of our highway system also has a direct affect on productivity. It is documented fact that countries that sustain a high level of public investment relative to output experience highway productivity growth.

During the past two decades, Japan has invested about 5 percent of its output in public works and achieved an annual productivity growth of over 3 percent. The West German experience is similar.

The United States, meanwhile, has maintained a low public investment ratio of three-tenths of a percent and seen inferior productivity growth just six-tenths of a percent per year. The fact is, the United States ranks 55th in the world in public capital investment. To me, that is a national embarrassment. It is also a sure prescription for economic decline.

Everywhere you look, nations that want to be a major players in the global marketplace have been investing heavily in surface transportation improvements: Germany, Japan, Hong Kong, Korea, China, Spain, etc.

Today, America's federal highway system—the backbone of our national economy—is in serious trouble.

While this network of highways and bridges comprises only 22 percent of the nation's total road mileage, it carries 81 percent of all travel—more than 1.6 trillion miles per year.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the federal-aid system are either "structurally deficient" or "functionally obsolete." The same report states that more than 40 percent of the pavements on the federal-aid system are in "poor" or "fair" condition (See figures 1, 2 and 3).

This 1989 report and the Federal Highway Administration's 1988 publication, America's Challenge For Highway Transportation In The 21st Century, both state that meeting existing capital needs on the federal-aid system alone requires a $40 billion per year investment in transportation construction projects—a rate of spending substantially in excess of the current obligations for the Federal-aid Highway Program.

Meeting these quantified needs on the federal-aid system is one of the major financial challenges facing the nation. Failure to provide an adequate and useable highway system will have a profound effect on the quality of American life, our economic growth and development, and our ability to meet national defense requirements.

The Federal-aid Highway Program has been a driving force behind building a better America. The reauthorization of this federal program should foster continued opportunities for growth and development.

If the program's reathorization legislation does not address known needs in a meaningful way, the deterioration of the Federal-aid Highway System, which is becoming more apparent every day, will continue, placing the American economy in danger. Today, highway disrepair and congestion are contributing to increased economic costs, air pollution and wasted energy resources.

Americans continue to commute by private automobile. Such travel is up 17 percent since 1960 and contributes to significant rush hour congestion on 65 percent of Urban Interstate System mileage. The outlook for the future is not good. Traffic is projected to grow by two to four percent per year in the decade ahead.

According to federal statistics, the nation now wastes 1.25 billion hours and 1.38 billion gallons of motor fuels due to congestion on limited access highways each year. By the year 2005, that waste could soar to 6.9 billion hours in lost productivity and 7.32 billion gallons of squandered fuel.

Economists at the U.S. Department of Transportation estimate that if our highways are allowed to continue to deteriorate, by 1995 the U.S. economy could potentially miss out on increases of 3.2 percent in Gross National Product (GNP), 5.9 percent in disposable income, 2.2 percent in employment and 2.7 percent in manufacturing productivity.

Disinvestment caused much of our current problem (See figure 4). Total public capital expenditures for highways and bridges has dropped from 1.4 percent of GNP in the early 1960s to about 0.5 percent today. During this same period, traffic on the Federal-aid Highway System has increased five fold.

Inflation has also been a hidden factor. Between 1959 and 1988, the U.S. inflation rate, as measured by the Consumer Price Index, rose slightly over 300 percent. The highway user fees supporting the Highway Trust Fund and paying for highway improvements increased by only 100 percent (See figure 5).

Assuming a moderate future inflation rate of four percent per year, the federal gasoline user fee would have to increase to 26 cents-per-gallon by the year 2000 just to maintain its 1959 purchasing power.

What should be done? The solution to our highway problem is obviously: we must begin investing in the future. Providing adequate resources is the key.

One alternative is to spend the current cash balance in the Highway Account of the Highway Trust Fund to address the call for greater highway improvement expenditures. But how far will that $10 billion balance go?

An examination of the language of the Highway Revenue Act authorizing the Highway Trust Fund shows that deficit spending in this fund is prohibited. Since the entire balance cannot be spent, the portion that is available, between $5 and $8 billion, will not significantly increase the current program.

Apogee Research, a leading public works consulting firm based in Washington, has developed a computer model for ARTBA which allows a review of possible program funding scenarios and their effect on the trust fund balance and program spend out.

The American Road and Transportation Builders Association believes a federal reauthorization package providing $40 billion per year for highway and bridge improvements is what is needed. Such a program level is totally consistent with the needs identified by the U.S. Department of Transportation referred to earlier in our testimony.

To authorize and carry-out a program of this magnitude, would require:

- Ensuring that all federal highway user fee revenue contributed to the Highway Trust Fund—plus interest earned on that money—is spent in a timely manner. A in the trust fund's current $10 billion-plus cash balance is part of this plan.

- Removing the Federal-aid Highway Program from the Unified Federal Budget in order to ensure that revenues are not impounded or withheld in the future.

- Increasing the federal highway user fees raise the additional $25 billion per year that is necessary for a $40 billion per year federal program of highway improvement assistance.

- No longer imposing artificial obligation ceilings on the expenditure of federal highway funds.

- Repealing the current six cents-per-gallon federal tax exemption on gasohol sales for highway vehicle usage (which causes an estimated $500 million per year loss to the Highway Trust Fund); and

- Tightening federal highway motor fuels collection procedures.

Such actions would assure that future generations have a highway system on which they can build. The historic role of the federal government in the development and upkeep of a national highway network should be maintained.

Recently, David Alan Aschauer, a senior economist with the Federal Reserve Bank of Chicago, and Richard Mudge, the former head of the Congressional Budget Office's Public Investment Unit, quantified the long-term national economic impacts of ARTBA's proposed program. Their findings are dramatic:

- By the year 2012, national productivity would be 7.7 percent higher, resulting in an additional $400 billion per year in Gross National Product; and

- The expected productivity gain would generate an additional $29 billion per year in corporate profits and a $35 billion annual increase in private investment. That is an excellent return on your investment.

There is no question that the federal government has a clear role to play in the development and upkeep of a national system of highways and bridges. The federal responsibility is defined by the Constitutional mandates to regulate commerce among the states and with other nations, provide for the national defense, and safeguard the public health.

America is literally at a crossroads. We can continue to ignore our serious and growing highway and bridge problem. Or we can choose to invest - about $40 billion annually - that is necessary to rebuild and expand our national highway network to meet current and future demand.

Good roads save lives, improve productivity and enhance competitiveness. In short it is an investment in the future.

I would also like to mention that we support the recommendations of the Transportation Research Board Special Report 225 especially the one that recommends adoption of the TTI HS-20/Formula B Bridge Formula. The TTI HS-20 Formula up to 80000 lbs. gross vehicle load considers HS-20 vehicles only and does not have the H-15 restriction as in the present formula. This is proper since hardly any H-15 bridges exist on the interstate any more. From 80000 up the present Formula B would be retained. This scenario is expected to produce shipper savings of $5.48 billion annually and have minimal cost impacts. There would be a net reduction in pavement costs of 10 million and an increase of 900 million in bridge costs per year. This presumes that all bridges with a load capacity of less than this formula will be replaced. In actuality most will be posted or strengthened which would reduce the annual cost significantly. This formula would provide considerble relief to short wheel base natural resource haulers.

Thank you for the opportunity to present the views of the Tennessee Road Builders Association before the committee. I stand ready to answer any questions that you may have.

TESTIMONY BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

NASHVILLE, TENNESSEE
DECEMBER 7, 1990

BY BOB SAUNDERS
PRESIDENT
NASHVILLE BICYCLE CLUB

Bicyclists have a stake in the development of a sustainable transportation system. Current dependence on oil and on single-occupant car travel has led to appalling levels of congestion, air pollution and a reliance on foreign oil that cannot be sustained. Nor can these problems be solved by building more highways. If reliance is placed solely on the traditional highway system to accommodate the anticipated peak hour traffic by the year 2010, the Nashville Major Street Plan is calling for 10 lanes on I-24 East, 6 lanes on Murfreesboro Road, and 8 Lanes on Bell Road*. The social, environmental, and economic costs associated with projects of this magnitude are staggering, and this is just one small section of Nashville. There are plans calling for similar expansion projects in all major metropolitan areas.

The encouragement of bicycling, pedestrian, and other alternative forms of transportation will help to provide some of the answers to our transportation problems. Statistics show that more than half the population lives within 5 miles of their work, or schools, and with the increase in the number of neighborhood and regional malls, most people live within a few miles of major shopping also. Many more people would ride bicycles or walk to these areas if it were safe to do so. I could not find a single crosswalk marking or secure bicycle parking place in all of the Hickory Hollow Mall area, yet the automobile parking overflows onto the area streets everyday during the Christmas season. Nashville Metropolitan Schools do not provide bus service to students that live within 1.5 miles (1.25 miles, K-5) of the school they're attending. In our neighborhood, some of the students must travel or cross Una-Antioch Pike to get to Apollo Middle School, or J.E. Moss Elementary - yet there are no sidewalks, crosswalks, crossing guards, or safe bicycling areas along this road. Situations like this encourage the use of the automobile and nothing else.

In the current Highway Act, there are few specific mentions about bicycling. More importantly, the language that does exist, only permits states to spend a portion of their federal money on bicycle projects. To do so, they must decide NOT to spend that money on other highway projects. In other words, the money is not "ear-marked" for bicycle use. Only 18 states have ever spent any of their federal money on bicycle projects. There is a lack of any real requirement or incentive to include provisions for bicycling--shoulders, lanes, separate paths or whatever they may be--in the design and implementation of projects funded by the federal government. The current law and practice still favors highway construction strictly for cars rather than the encouragement of alternatives to the automobile.

In the upcoming legislation, I encourage you to include the following:

1. A statement of policy calling for greater recognition of bicycling as a legitimate and practical means of transportation capable of helping to solve many of the environmental, social and economic problems faced by the transportation system in urban and suburban areas.

2. Stronger language to the effect that any transportation project constructed or reconstructed with federal dollars should be accessible to, and usable by, bicyclists, except possibly those highways where access is to be fully controlled. This should be in addition to the current language, and would include both highway and transit expenditures.

3. A requirement that states spend a minimum of 3% of their federal-aid highway dollars on independant construction and non-construction bicycle and pedestrian projects.

---

Statement By
L. E. (Les) Sutton, President Ingram Barge Company
before the
Committee on Public Works and Transportation
Nashville, Tennessee
December 7, 1990

My name is L. E. (Les) Sutton, I am President of Ingram Barge Company of Nashville, Tennessee. Ingram Barge Company, a subsidiary of Ingram Industries Inc., is a large diversified barge company operating 1400 barges and 60 towboats throughout the inland water system.

I appreciate the opportunity to testify before this committee during its in-depth study of infrastructure needs. I could tick off a long list of instances of neglect of infrastructure, supporting the inland waterway industry, and I will discuss some specifics later, however I first want to emphasize the far reaching consequences of this neglect.

It should not be surprising that our industry's infrastructure needs, our successes and failures track pretty well with the rest of our country. Since our industry is fairly small, some of the relationships between infrastructure and the well being of our industry, the well being of the people and related industries may be a little more obvious than in some other areas.

While I believe this committee understands the concept very well, the thrust of my statement and the philosophy behind it is that an industry or an areas' competitiveness and well being is inextricably tied to its infrastructure. If an area keeps its infrastructure modern and well maintained it will prosper. If it doesn't, almost regardless of what else it has or does, it will suffer.

I also believe that providing the major infrastructure or at least providing major infrastructure policy and direction is a function of the federal government. If that is true, infrastructure problems and policy also are inextricably tied to politics and political will.

As a brief aside, but as a crystal clear and frightening example, Russia produced a record wheat crop this year, but as a consequence of neglected infrastructure and related systems there are severe shortages of bread. This is the simplest of examples. It doesn't require much technology or infrastructure to turn wheat into bread, but if neglect and mismanagement are carried to extreme, even that can't be done. So if a breakdown of infrastructure and political will can so impair an economy that it cannot even bake bread, how careful we must be with ours when we are trying to compete in automobiles and machine tools and electronics.

My first example of how infrastructure can help an industry be competitive involves grain in the U.S. A series of locks and dams were constructed on the upper Mississippi River between St. Louis, Missouri and Minneapolis, Minnesota, and on the Illinois Waterway from St. Louis to Chicago, Illinois. These projects were completed shortly before World War II which allowed production of substantial war materials including many naval vessels, far inland out of the reach of German submarines which threatened our coastlines.

After the war, a highly efficient transportation and marketing system for exporting grain developed along these rivers which collected the grain from the farmers, transported it down the rivers to New Orleans, then exported it around the world. This system was so efficient that it allowed the U.S. to capture over 33% of all the corn and 75% of all the soybeans purchased in the world market.

During the mid seventies, however, a series of political blunders, using grain embargoes for political purposes coupled with a ridiculous environmental fight over replacement of Lock & Dam 26 at St. Louis raised doubts about the United States' viability as a reliable source of supply for grain. In response foreign investors, principally Japanese built infrastructure in grain producing countries in South America. Europe increased its subsidies to farmers. Now the U. S. supplies 34% of the corn and 41% of the soybeans in the world market.

We gained this market with superior infrastructure. We abdicated much of it with political stupidity and the threat of infrastructure obsolescence.

The problem with losing markets due to inadequate infrastructure is that the decisions often come when the industry seems to be doing very well. Think of steel, automobiles, machine tools, television sets, radios, toasters---you can complete the list; or can you? Actually the list isn't complete yet other items are still being added.

Let me now turn to my industry, the inland waterways, and relate it to the infrastructure in middle Tennessee. Actually middle Tennessee isn't as dependent on the waterways these days as are many of our neighbors. Sure we have the Cumberland River and I'll get back to that, but for now visualize a map of the major rivers in the U.S. The Mississippi runs from Minneapolis to New Orleans. The Ohio starts at Pittsburgh, runs through Cincinnati and Louisville, and joins the Mississippi at Cairo. The Tennessee starts in the mountains east of Knoxville and drops south through Chattanooga, Guntersville and Decatur before joining the Ohio at Paducah.

So modern Nashville developed a different kind of industrial base than did some of its neighbors who had better access to low cost water transportation. Even so do not discount the influence that the Cumberland River had and still has on Nashville's ability to compete and the ability to produce goods and jobs.

I expect that my next point will be better explained by others but also visualize with me a map of the U. S. with the interstate highway system. As you visualize Nashville on that map with I-40 running east and west, I-65 running north and south and I-24 cutting through diagonally from St. Louis to Atlanta, can you see any other city of Nashville's size with a pattern of interstate highways as favorable as Nashville's?

As any serious geography student can tell you, and as our Chamber of Commerce often does, this system of highways has determined the kind of industry that has developed in middle

Tennessee. It has clearly been a factor in our success in attracting many of the businesses we now have. It is obvious that if we are to continue to compete in this world market for automobiles, electronics and other very very competitive products that we make, we must not only maintain but must continue to upgrade this transportation asset that we possess.

I have long been a proponent of maintaining our competitiveness by keeping our infrastructure up to date. The two subjects here --interstate highways and political will remind me of a statement I made in 1982 which was published in Seaway Review. I said "President Eisenhower was the last of our national leaders who understood the value of infrastructure." That of course was simply my own opinion but as I look back over 40 years of history, that statement still seems relatively true.

Before I return to the Cumberland River, let me remind you of the basic economic premise on which this paper is based. To be successful, a business, an industry or an area cannot be at a disadvantage to its competition in any area of its production cycle. Infrastructure is so key to production costs increased costs due to infrastructure deficiencies are paid for again and again and again.

Using automobile production as an example and assuming that we allow our highway systems to deteriorate would obviously increase the cost of delivering our automobiles to our market. It would also obviously increase our cost of the parts we shipped in. There are many other cost increases that are not so obvious and I believe that these less obvious costs were a major factor in the decline of much of the U.S.'s productive capacity during the 60's and 70's. We believed that we could pass on these cost increases while our more preceptive foreign competitors were constantly looking for ways to improve their quality and lower their costs.

Some of the less obvious cost increases for an automobile manufacturing plant would be the cost of food for its workers, the lettuce, tomatoes, and citrus that comes up I-24. The beef that comes across I-40. The lumber to build their houses, plumbing supplies, construction materials for shopping centers, etc.

All of the inputs in to any economy finally affect the cost of producing almost any output. This is why we pay again and again for inefficient infrastructure affecting the cost of manufacturing. This seems like simple economics which should certainly be understood by any of our leaders in policy making roles. One doesn't have to look very far back to realize that it apparently isn't.

As I joined my fellow Americans each evening this summer watching the daily comedy of which taxes to increase, my moods went from amusement to disgust to despair as I watched politicians who I believe understood basic economics float proposals to increase taxes on our costs of production. I finally decided that economics and the well being of our country and its competitiveness had nothing to do with the tax bill but at least 99.998% of the proposals were based on how many votes that particular proposal would gain or lose for the proponent.

Clearly you gentlemen must face the hard choices of the realities of our economy. Clearly it is the easy, politically expedient route to neglect our infrastructure because the results probably won't show up for 2 or 3 more terms, but when they do, then it is too late. How hard would it be for us to regain the market for TV sets. How about VCR's. Once you lose a market to an efficient competitor you don't get it back. So my exhortation to you is not to allow our infrastructures to continue to deteriorate, but to make those hard choices, sacrifice in an area that doesn't affect our production capacity and pay the price of rebuilding and maintaining our infrastructure.

I also noticed during the budget debate that a lot of federal budget expenditures were referred to as entitlements, which were assumed to be non controllable. Make no mistake about it, when you neglect our infrastructure and/or otherwise increase our costs of production you are clearly increasing the future costs of these entitlements as our markets are abdicated to foreign producers. Just as entitlements can't be reduced, neither can they be kept from increasing as jobs are lost.

Now let me return to the rivers and finally to the Cumberland River. Yes, our industry has the same problems that most industries have. We too went through that 20 year period of neglect. The average lock and dam on the inland waterway system is 50 years old. Many of them should be replaced over the next few years, but like other industries which suffered this infrastructure neglect, we cannot correct it immediately. In addition to having more needs, the neglect caused us to lose markets so we have less money to replace that capital.

I outlined to a group of waterway leaders meeting in New Orleans, in September some of the hard choices we in the waterways industry must make. They are similar to the hard choices you must make. We both must first decide that our infrastructure must be rebuilt then we must decide which parts of that infrastructure must be done first. You like we must make those hard choices. You must make an occasional choice that might not gain the most votes but is the right thing to do.

Our industry is fortunate to have the Inland Waterway Users Board to help Congress and the Corps prioritize waterway infrastructure expenditures. That board met earlier this week in Paducah, Kentucky to examine the needs of the lower Ohio, Tennessee and Cumberland Rivers. Ingram Barge Company's Chairman, Mr. Neil N. Diehl serves on that board, so I believe that our industry is in better shape than some others when it comes to addressing our needs. There is one problem of course. There is not enough money to do what needs to be done.

Now I'll close by returning to the choices that we have for the Cumberland River and middle Tennessee. Fortunately our choices aren't too tough. We have a few bridges that are hazards and restriction to navigation. We have two major projects downstream from us that affect our costs. Both are being addressed, but we need your continued support. The most important is the construction of Olmstead Lock & Dam on the lower Ohio and the second is the construction of an additional lock at Kentucky Lock & Dam on the lower Tennessee.

How do these projects and the Cumberland River affect the cost of production in middle Tennessee? All the cement, all the asphalt, most of the aggregate used in the construction industry arrives in Nashville by barge. So if costs increase on the Cumberland River, the cost of highways, factories and houses increase. Remember how many times you would pay for these costs in the price of an automobile or any consumer good produced in middle Tennessee.

I know that there are many many other competing needs for federal funds. I also know that many of these needs are generated because our economy isn't producing enough jobs. The quality of our infrastructure affects our ability to compete and provide these jobs. It affects it today and it affects it 20 years in the future. You understand that. What you need to do now is to build a story that will convince your other colleagues in Washington to make the hard choices necessary to upgrade our infrastructure which upgrades our competitiveness which will ultimately reduce many of the Federal Government's "social costs".

Thank you again for allowing me to share my thoughts with you.

ADDITIONS TO THE RECORD

STATEMENT OF JIM BRANAGAN, JEFFERSON COUNTY ENGINEER

JEFFERSON COUNTY HIGHWAY SYSTEM

The Jefferson County Highway Department is responsible for maintaining 263 miles of county roads and 264 highway bridges. In addition the county offers assistance to the townships with their 448 miles of highways.

In the summer of 1989 an inventory and needs analysis of the county highway system was conducted by the County Engineer. Data such as road width, guardrail lengths, sign locations, culvert sizes, etc., were noted. In addition to existing conditions, deficiencies and needs were investigated and evaluated. The overall purpose of the study was to determine the physical characteristic and conditions of the existing road and bridge system and determine what improvements are needed to bring the highway system up to an adequate level of condition and safety.

A summary of the results of the study follows:

Pavement - Approximately 48 percent of the pavement surface (125.6 miles) was found to be in poor condition (severely cracked with potholes) and in need of resurfacing or total reconstruction. The rating evaluation of the pavement was based on eight (8) types of distress and three (3) degrees of distress.

Signs - The oldest device for controlling, safeguarding and expediting traffic is the traffic sign. Approximately 920 new signs (3½ signs per mile) are needed such as for sharp curves or hidden drives.

Guardrail - The Ohio Department of Transportation recommends using guardrail on slopes steeper than 3:1 or at fixed objects such as trees. According to that criteria, the county highway system needs approximately 41 miles of guardrail.

Slips (Earth Slides) - Jefferson County's hilly terrain and soil types make our roads especially susceptible to earth slides. Slips can cause minor damage such as pavement cracks to a complete loss of road lanes. Numerous slips are encountered along Jefferson County Roads. Fixing

Continued ...

Slips (Earth Slides) (continued) - a slip usually involves piling, walls or earth moving techniques which are all relatively expensive. The cost to fix a slip along 1/2 mile of County Highway 7F is estimated at 1.3 million dollars!!

Bridges - 78% of the County Bridges are in fair condition and 10% are in poor condition. However, that 10% represents 32 bridges which require repair or replacement and pose a potential hazard to the public.

Building & Grounds - The County Highway Department needs storage facilities for equipment and salt. Underground fuel storage facilities have to be upgraded to meet new guidelines from the State Fire Marshalls Office.

Equipment - The Highway Department uses over 100 pieces of equipment such as snow removal trucks, graders, backhoes, loaders, mowers, pickups, etc. As finances become scarce, new purchases have dropped and more dependance is placed on older equipment. Approximately 35% of the highway department equipment was found to be in poor condition and in need of replacement.

HIGHWAY BUDGET NEEDS - (1991)

	Needs
Roads (Reconstruction & Resurfacing - 40 miles)	$ 700,000.00
Bridges (Repair/replace 5 per year)	$ 300,000.00
Guardrail (2 miles per year)	$ 200,000.00
Signs (200 per year)	$ 20,000.00
Slips (Fix 2 or 3 per year)	$ 200,000.00
Building & Grounds (Storage Facilities)	$ 250,000.00
Equipment (Replace equipment based on 7 to 25 year service life)	$ 240,000.00
TOTAL	$1,910,000.00
1991 BUDGET ALLOCATION	$ 770,000.00
ANNUAL SHORTFALL	$1,140.000.00

Continued ...

Since our 1991 budget allocation is projected to be only 40 percent of the needs, a reduced paving program and limited bridge program is contemplated for next year. No guardrail and only a few signs will be installed in 1991. Also, no monies are available to correct slips, install storage facilities or purchase much needed equipment. As deficiencies are left unattended, the cost to repair escalates unproportionately compounding the problem.

In summary, the County Highway System with its many miles of roads, numerous bridges and related ancillary devices is in a fragile and precarious position. The lack of funding to meet the annual requirements is too large not to have an adverse major affect. Without additional financial support the County Highway System as we know it today will cease to exist and will be subject to an involuntary downgrading to meet bare minimum requirements.

Jefferson County
Highway Department

1989 INVENTORY
and
NEEDS ANALYSIS

Prepared By:
James F. Branagan, P.E., P.S.
Jefferson County Engineer

AVERAGE COUNTY ROAD:

- 18 1/2 Wide & 3.5 Miles Long

LONGEST COUNTY ROAD

- CR 56 - 12.83 Miles

HEAVIEST TRAVELED ROAD:

- CR 77 *(Permars Run Road)*
- 9740 Average Daily Traffic

PURPOSE:

To plan a county road improvement program, the County Engineer and County Board should know the physical characteristics and condition of the existing road and bridge system. The inventory is the first step which involves data collection. The second step is to evaluate the data and determine what improvements are needed to bring the highway system up to an adequate level of condition and safety.

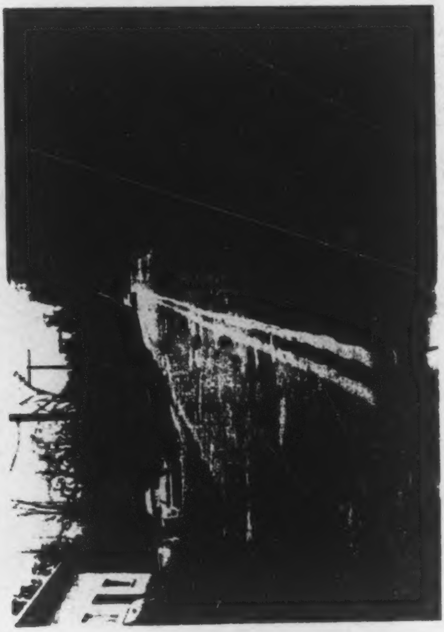
The final goal of the inventory and needs study is to provide a firm basis for selection and scheduling of improvement projects, for sound financial planning and for achieving informed public support for the county's highway improvement efforts.

PAVEMENT

Surface Condition

Good	Fair	Poor
68.4 Miles 26%	67.1 Miles 26%	125.6 Miles 48%

GOOD	**Pavement has only a few potholes and nominal cracking. Minimal maintenance and attention is required.**
FAIR	**Potholes and cracking are more prevalent. Patching and sealing are required to preserve pavement.**
POOR	**The pavement is severely cracked and riddled with potholes. Resurfacing and/or base reconstruction are required at the present time.**



SIGNS

Need 920 New Signs

- Estimated Cost - $100,000.00

GUARD RAIL

Need 41 Miles of New Guard Rail for Safety Purposes

- Estimated Cost - $865,000.00

SLIPS

Major Slips: Terrain Related

- CR1
- CR4
- CR6
- CR7F
- CR14
- CR25
- CR26
- CR28
- CR34
- CR56
- CR68
- CR74

- Estimated Cost - ??????

Each slip has to be investigated and evaluated separately. Cost will run into the millions.

DRAINAGE

EVERY County Road has drainage problems.

Ditching and Culvert Installation Require Continual Effort.

- Estimated Cost - $10,000.00 Average

BRIDGES

264 Bridges on County and Township Roads

TYPE		
Steel Trusses	28	11%
Steel Beam/Girder	77	29%
Concrete Beam/Slab	119	45%
Stone/Timber	8	3%
Culverts	32	12%

LENGTH		
200' or over		5
150' to 200'		4
100' to 150'		25
75' to 100'		7
50' to 75'		27
40' to 50'		23
30' to 40'	*(average 30')*	30
20' to 30'		57
10' to 20'		81

BRIDGE CONDITION

Good Condition 10%	No Repairs Needed or Potential for only minor repairs.
Fair Condition 78%	Potential Exists for major maintenance.
Poor Condition 12% *(32 bridges)*	Repair, rehabilitation or replacement required.

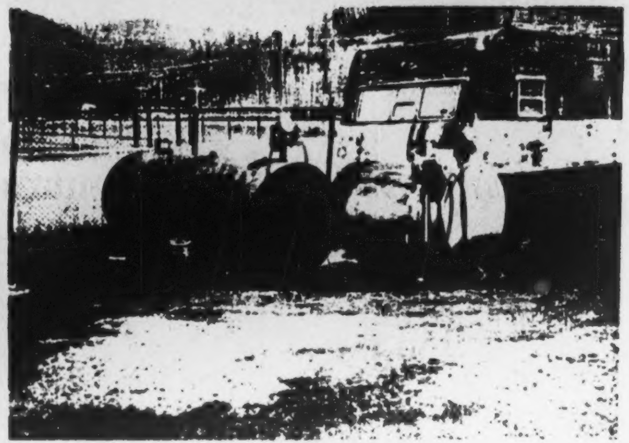
264 Bridges divided by 50 Year Service Life = 5.28 Bridge Replacements per Year.

- **Estimated Cost - $250,000.00/year**

BUILDING & GROUNDS

County Garages:
- Jefferson County Services Complex - 1983
- Smithfield Garage - Major Renovation Required, Roof and Floor. Yard - Unsatisfactory.
- Irondale Garage - Older Facilities.
- Wolf Run Garage - Older Facilities.

Future Plans	Relocate Smithfield Garage. Combine and relocate Wolf Run and Irondale Garages.
Additional Needs	Storage Facilities for Winter Salt - all Garages. Storage Facilities for Equipment. Underground fuel storage facilities.



EQUIPMENT

The Highway Department uses over 100 pieces of equipment having a value *(new)* of over $3.1 million dollars. The equipment includes such machinery as graders, rollers, backhoes, loaders, trucks, pickups, etc.

A survey of the equipment condition indicated the following:

Good	Fair	Poor
25%	45%	35%

- **Estimated Annual Replacement Cost** ***(Based on Service Life Ranging from 7 to 25 years)*** **$240,000.00**

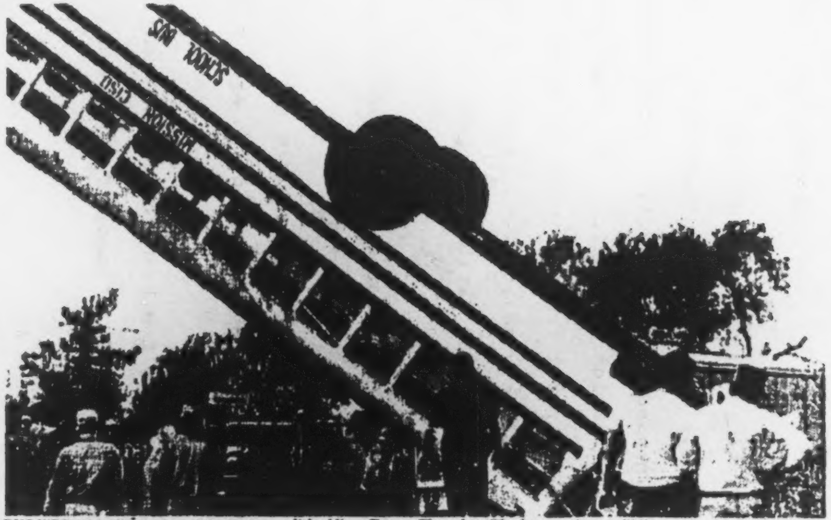
School Bus Accident Stuns Town



BUS WRECKAGE. Workers lift a Mission, Texas, school bus from a gravel pit in Alton, Texas, Thursday. The bus plunged into the water-filled gravel pit after colliding with a delivery truck Thursday morning. (AP Laserphoto)

REMARKS BY RICHARD CURRAN TO THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

DECEMBER 7, 1990

Distinguished Chair & Members of the House Committee on Public Works and Transportation I am Richard Curran, Tennessee State Delegate to the Community Transportation Association of America. I manage a Section 18 and Title III-B rural transportation program serving the 12 counties immediately adjacent to Davidson County. I also served on the UMTA RTAP National Program Review Board.

I commend you for coming to Nashville.

Transportation is the straw that blends the mix and is the key to the development of an area's infrastructure.

Our Agency has been delivering some form of transit service to the rural citizens of North Central Middle Tennessee for over 15 years.

Our efforts have been made possible because . . .

In 1973, Section 147 of the Federal Highway Act opened the door for transportation in rural areas. This demonstration program revealed that, once you put vans and buses on rural roads, indeed people would ride them.

As a result, in 1978, Congress passed Section 18 of the Urban Mass Transportation Act which provided formula transportation grants for places other than urbanized areas.

At the time, Congress enacted Section 18 Program a new Dodge 15 passenger van cost less than a fully equipped 1991 Yugo--about $7,800.00. Gasoline cost about $.60 a gallon, and the daily newspaper cost $.20. The minimum wage was $2.60, while an individual's group medical insurance cost was around $35.00 per month.

In FY '79, the State of Tennessee Department of Transportation allocated $300,000 to rural transportation.

For FY '91, about $65 million has been allocated to Section 18. That is a decrease of 13.3% since FY '79.

For FY '91, the State of Tennessee Department of Transportation will spend $2.45 million for rural transportation, an increase of over 800% since FY '79.

Just in the last year, we have seen:

*Minimum wages increase from $3.35 per hour to $3.80 this year and $4.20 next year; and we support that, but without increased dollars, it will result in a reduction in rural trips. Every 12 hours of work at the new and higher minimum wage will cost us two rural trips.

*Americans with Disabilities Act--and we support that, but without increased dollars, it will result in a reduction in rural trips. Every new lift will cost us 600 rural trips.

*Drug testing--and we support that, but without increased dollars, it too will result in a reduction of rural trips. Every time we test a driver, dispatcher, mechanic, or any other person considered for any of those jobs, it will cost us 15 rural trips.

I repeat, in FY '79, the Federal Section 18 appropriation was $75 million. Today, Section 18 is funded at $65 million.

For us to acquire the same purchasing power in 1991 as we had in 1979, we would need about 150.9 million.

Rural Americans comprise 39% of the nation's population and they need your help to maintain their infrastructure:

*40% of the elderly live in the rural areas
*42% of the poor live in the rural areas

*43% of the people with disabilities live in the rural areas.

And they are becoming increasingly more isolated because their local infrastructure is deteriorating. Despite consisting of 39% of the population, the rural areas receive less than 4% of all federal public transit assistance dollars.

Federal transit funding equals about $1.00 for each rural resident, but exceeds $28.00 for their urban counterparts.

A rural citizen's need for transportation is just as great as is that of his urban neighbor.

We who serve the rural areas need your help.

The process of reauthorizing our federal transit legislation and programs not only gives us the opportunity to renew and restore federal investment in rural transit; it also gives us a chance to reassess our existing policies and respond to changes that have occurred in our transportation needs since the last reauthorization.

Thank you for your time and attention.

TENNESSEE RIVER VALLEY ASSOCIATION

December 7, 1990

STATEMENT OF TENNESSEE RIVER VALLEY ASSOCIATION AND THE TENNESSEE-CUMBERLAND WATERWAYS COUNCIL

Before House Committee on Public Works and Transportation, Nashville, Tennessee.

Committee Members:

We appreciate the opportunity of appearing before your committee today to address the issue of our region's infrastructure needs.

I am Jack Herbert, President of the Tennessee River Valley Association (also known as TRVA), of which the Tennessee-Cumberland Waterways Council (also known as TCWC), is a division. These organizations have over 200 members in the Tennessee-Cumberland River region. We promote the economic development of the region, the on-going maintenance and development of the Tennessee and Cumberland Rivers and their tributaries.

Between these two waterways, there are over 50 million tons of traffic moving, which are critical to the continuous commerce and industrial needs of communities in our region. We wish to emphasize the importance of our waterways to the economic vitality and needs of our region. And also, to the necessity of being sure that these important arteries of traffic receive needed attention, so they may keep pace with other modes of transportation and with other regions.

These waterways have been a major influence in bringing in new industry, such as Nissan, Saturn and other major industries receiving their raw mateials by water. The river system provides a major outlet for agriculutral commokities produced in the Middle Tennessee region.

Important studies are underway for rebuilding Kentucky Lock and the Upper Tennessee Locks and other important improvements needed, to keep our system functional and efficient.

We respectfully request that these infrastructure needs, along with the Interstate Highway needs, be given complete study and appropriate consideration of overall future needs of our region.

Our organizations would welcom the opportunity to assist in any way, in developing specific information to define the infrastructure needs of our Middle Tennessee area.

Thank you for your attention and for allowing us to appear at your hearing.
